Stephen Leacock

contributes an article "Is Permanent Peace Possible?"—an excellent summary of conditions governing international relations.

Robert W. Service

supplies another of his wonderful war poems "The Flowers," written at the front, where he is driving a motor ambulance.

Agnes C. Laut

writes on "Business--and the Fatal Spiral," an excellent article dealing with a serious condition in business which has developed.

Arthur Stringer
Arthur E. McFarlane
L. M. Montgomery

These three well-known Canadian authors give brilliancy and distinction to the fiction contents.

H. F. Gadsby

contributes an article on Dr. Michael Clark, M.P., the Free Trade advocate of the Commons.

All in the August issue of MacLean's Magazine, together with a dozen other features, and the Review of Reviews department. Get a copy at your news-stand, or, better still, send in your subscription. Yearly subscription price, $1.50.

BE READY

If you wish to take advantage of the extensive "Made in Canada" campaign, prepare to meet competition by consulting our expert engineer for the manufacturing of your special machinery.

LYMBURNER, LIMITED
Commissioner and Berri Sts., Montreal
CANADA

For Rapid Production and Accurate Work
USE THE
"BRIGGS"

The Briggs Miller handles work no other machine of its size can touch. It is a manufacturing machine. On account of its rigid construction it will produce accurate work when running at a high rate of speed and feed.

Fast

The Base Tank and Large Gear Pump is the latest addition to its many advantages. Tank holds 20 gallons of cutting lubricant.

Pump never requires priming and will deliver ten gallons per minute to the cutters, keeping them cool when run at very high speed.

Our booklet describes fully. Drop a card for it.

READ PAGE 88

Don't Crowd Your Large Machines

You cannot manufacture small parts economically on a large machine. Steptoe Small Power Feed Millers and Hand Millers are especially adapted for that kind of work, a stiff, heavy tool that can be quickly handled and crowded to the limit. That is the machine to buy for small parts.

If your Planers are crowded take the small jobs and put them on a Steptoe Shaper and you will do them quicker and you will have less money invested in equipment.

STEPTOE SHAPERS "Just a Little Better."

D'Olier Improved Type Chip Centrifugal

For recovering and filtering oil from automatic machined parts, metal chips, turnings, scrap, etc.

A large capacity, extremely efficient machine, especially designed and built to care for the "rush" character of work and the increasing volume of shop output now prevailing.

SPECIAL FEATURES

Weston type, self-balancing basket, 30 in. diameter, motor driven.

Bottom chute discharge and conical unloading valve.

Centrifugal oil filter attachment.

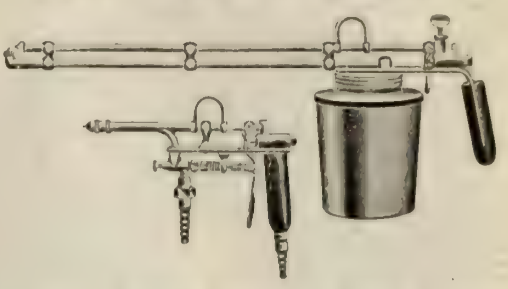
The 30" Weston type self-balancing basket, which is the largest capacity for this service, is of the non-removable type. No service (removable) baskets are required for this machine, the load being dumped into the operating basket and discharged by means of our special conical unloading valve and chute, which is a great time-saving feature.

The centrifugal oil filter, with which the machine is equipped, is operated by the main driving belt, the complete unit being therefore self-contained, simultaneously recovering and filtering the oil from the chips, turnings, etc.

D'Olier Centrifugal Pump and Machine Co.

Morris Building, Philadelphia, U.S.A.

AMMUNITION SPRAYERS



For Lining Shells, Spraying Paint, Lacquer, Oil. Etc., on all classes of ammunition

THE ONLY PRACTICAL SPRAYER

E. W. BLISS COMPANY,
Borough of Brooklyn, New York,
August 23, 1915.

Eureka Pneumatic Spray Co.
62 Ninth Avenue, New York City.

Gentlemen,—Replying to your letter of August 17th, would say that No. 135 Sprayer has proven very satisfactory, and has eliminated various troubles experienced with Sprayers of other manufacturers.

In regard to the number of shells being sprayed, would state that each operator sprays on the average 450 3" shells per hour.

Trusting that the above will put you in possession of the information you require, we are

Yours very truly, E. W. BLISS COMPANY,
(Signed) H. E. Norwood.

EUREKA PNEUMATIC SPRAY CO.

62-64 NINTH AVENUE NEW YORK, U.S.A.

FRED'K CRANE CHEMICAL CO., Sole Agents for Great Britain, Birmingham, England

---

MALLEABLE GREY IRON ALUMINUM & BRASS CASTINGS

The selection of metals and the necessary treatments are governed by the purpose for which each casting is required

The quality is always of the highest standard.

Our castings "stand up" to service where others fall down.

Try them and you'll be convinced.

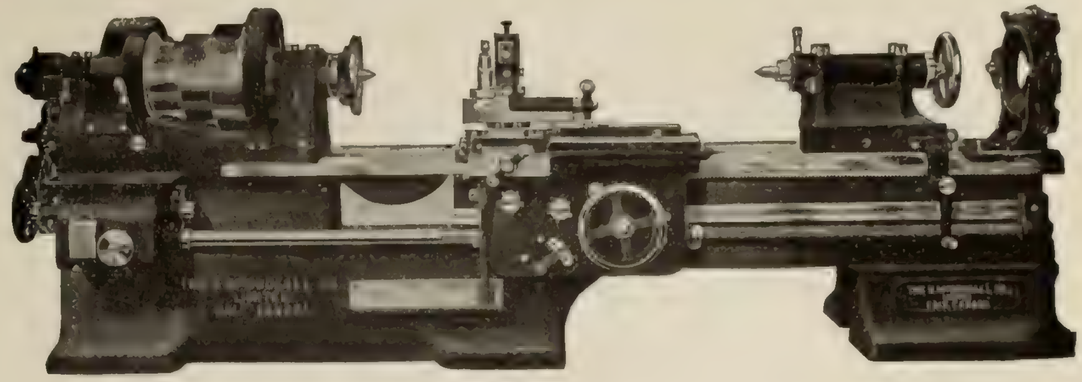
McDougall Gap Lathes



—

Strength
Accuracy
Quality

Take a look at the next money you intend to invest in a Lathe. Then, take a look at the money's worth we offer you in our machine. Your money will soon come back to you in increased production and we will have the pleasure of having a satisfied user. Our machines are just as good as they look and they look good too.

We invite the closest inspection.

ARE-MAC-DEE IS A GUARANTEE

The Mark of Distinction in Machine Tools

C.M.C.

Registered Trade-Mark of the Canada Machinery Corporation, Limited

All machine tools (wood or iron-working) bearing this trade-mark are guaranteed to be of the best standard in quality and workmanship.

C.M.C. regular machine tools are performing a great service on munitions which proves that power, rigidity and accuracy are not lacking in our tools.

For convenience of the trade we have opened Showrooms in Toronto at Brock Avenue Subway, where a full line of our Machinery can be inspected.

WHY P. & W. Taps WIN

It's in the Design

One-third of the land from the cutting edge is concentric.

The remaining two-thirds has eccentric relief.

The taper-tap has a cylindrical pilot.

The taper and plug-taps have an eccentrically-relieved chamfer relieved clear from the cutting edge. The highest grade of steel obtainable is used.

What it Means to You

Taps can be sharpened at the only correct point—on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life—an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible with a commercial tool.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.

The Tap with the

A List of Shell Manufacturers

WE were recently able to obtain a revised list of shell manufacturers in Canada. As a matter of interest, we checked it up with our subscription list, and while not surprised, we were, nevertheless, gratified with results, which follow:

¶ Eighty per cent. of ***firms*** manufacturing munitions are subscribers to CANADIAN MACHINERY.

¶ Five per cent. are advertisers and thus entitled to copies on their contracts.

¶ From records in our office, we were able to determine that ninety-nine per cent. of all munition plants are represented on our subscription list, either through the firms themselves or some one or several of their business executives or through their superintendents, works' managers, foremen, engineers, etc.

¶ The remaining one per cent. remains in doubt—but not for long.

¶ Let it be known that the list referred to was supplied in confidence, and cannot be given out.

THE BANFIELD PLUG MILLER

Patents applied for in Canada and United States

THIS machine is especially designed for finishing base plugs, turning the outside diameter, finishing the face with any camber desired, and milling the thread, all in one chucking, the complete plug being finished in six minutes by unskilled labor.

The machine is equipped with quick draw in collet. Drive pulley 18" x 6", with bronze bush having cut jaw clutch for turning and facing. Worm gear 100 to 1 ratio, with cut jaw clutch for milling, driven by 10" x 1½" flanged pulley. The milling cutter is driven by an 8" x 2½" flanged pulley. Tool post carriage is equipped with power feed (two speeds) having automatic stop. Power feed pump with relief valve driven from worm shaft **(all drives direct from main line shaft).** Rigidly built, simple and economical to operate.

Weight 1,800 lbs.

For 18 pdr., 4.5 and 60 pdr. High Explosive Shells, Can furnish machines of same type, but somewhat lighter in construction. Particulars on request.

These machines are tooled up for finishing plain machined plugs if desired.

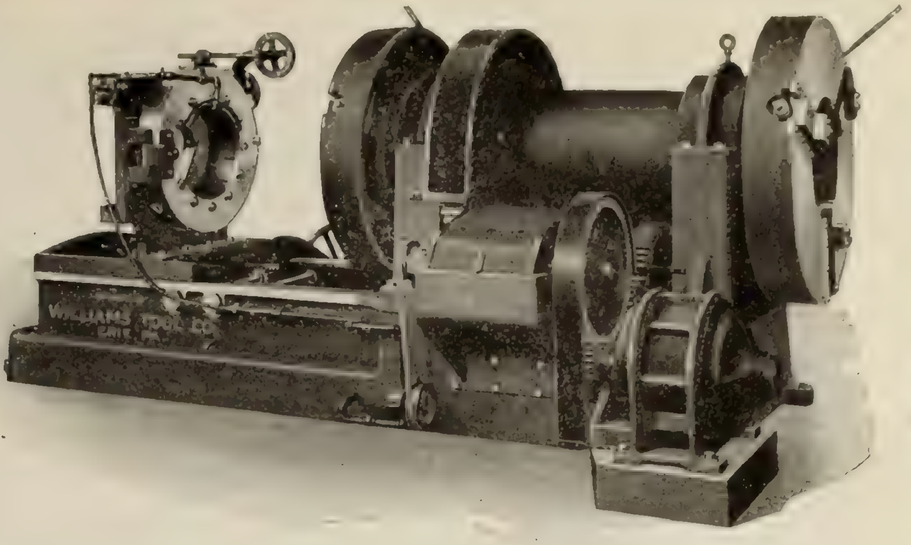
WILLIAMS PIPE MACHINES

Received Highest Award at Panama Exposition



The Following Letter Explains Why:

Williams Tool Co., Erie, Pa.: Rochester, N.Y., 12-3-14.

Gentlemen:—We are so pleased with our No. 3 Pipe Machine, and it is doing such splendid work for us at a minimum of expense that we are now considering the advisability of displacing two smaller machines for one of your No. 1½ or No. 2 motor drive.

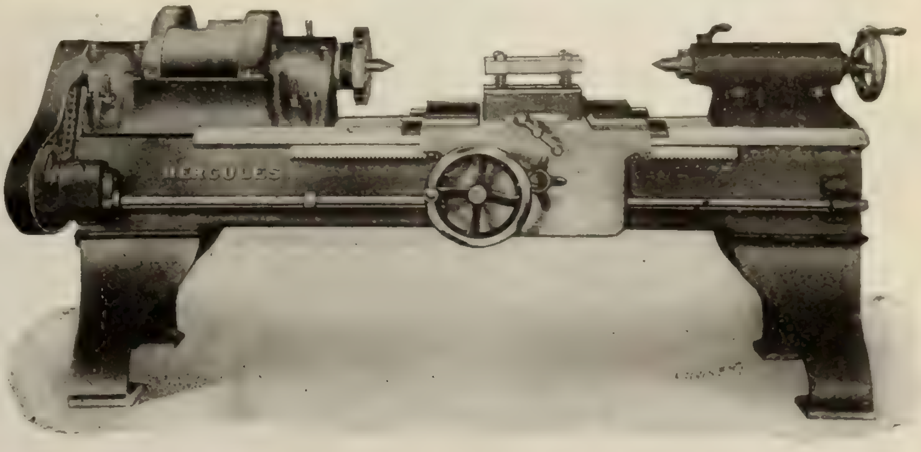
The machines which we would displace, if we make a change, are belt drive, are (names of two of the oldest and best known machines on the market) equipped with nipple holders, extra dies, etc. Both of these machines are still in fairly good condition. On what basis could we make an exchange with you?

Yours very truly, SAMUEL SLOAN & CO.

WILLIAMS TOOL CO. - - - ERIE, PA.

How Lathe Simplicity Solves Labor Problems

The great simplicity, the compact, convenient design, make the Hercules Lathe an ideal single-purpose machine. To train an unskilled laborer to perform accurately one or two operations on this machine requires but a short time. The rugged, powerful construction then enables that laborer to turn out precise work continuously at the maximum speed.

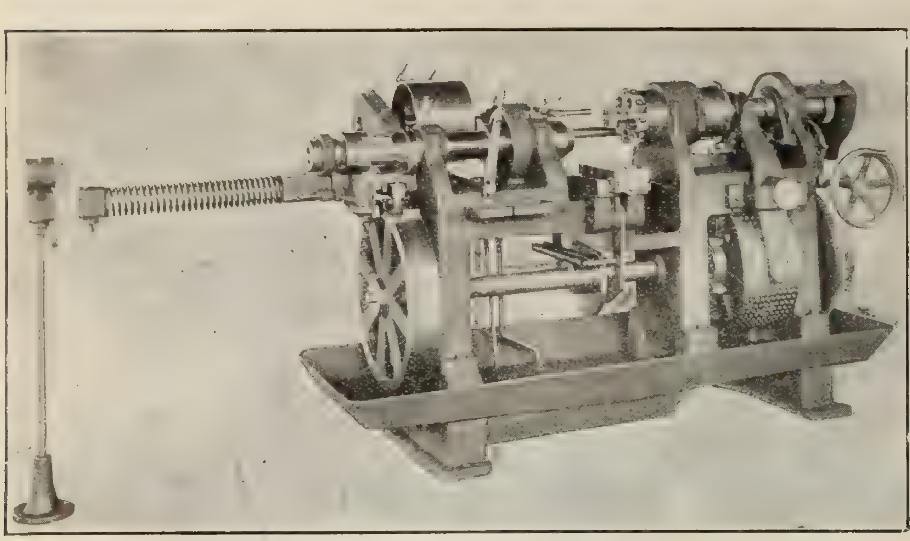


Where skilled mechanics are not always available — the Hercules Single-Purpose Lathe is the logical machine tool.

At the present time, we can still make early deliveries. Write — at once—for full details.

HIMOFF MACHINE COMPANY, INC.

128 MOTT STREET, NEW YORK CITY



No complicated mechanism or a system of cams that are difficult to determine and arrange on this machine

The rigidity of the machine has not been sacrificed for the flexible features which are embodied in the Chicago Automatic. Alignment is correct and there are no parts where excessive wear takes place—therefore, **accurate production** is assured during the long life of the machine.

In less than six weeks we can place Chicagos in your plant ready for production

The Chicago Automatic Screw Machine

Spindle speeds suitable to different sizes and kinds of stock within the capacity of the machine are obtained by changing two gears on the spindle head.

TEN YEARS OF EXTENSIVE MANUFACTURE OF ONE PRODUCT—AUTOMATICS—STAND BEHIND EVERY MACHINE.

They must satisfy you before we consider them sold.

"STERLING" HACK SAWS

Sterling
POWER HACK
SAW MACHINE

MANUFACTURED BY
DIAMOND SAW & STAMPING WORKS
BUFFALO, N.Y., U.S.A.

You Could Read a Whole Book

of advertisements describing the PEERLESS HIGH SPEED, and yet you could not fully comprehend its many exclusive features. Why not try one of these machines out under your own cutting conditions and satisfy yourselves that it is a real high speed steel cutter and time saver.

A wonderful improvement in the PEERLESS HIGH SPEED is the feeding mechanism, which is very essential in securing the highest efficiency from a blade. Instead of piling a lot of weights on top of the saw frame, a little coiled spring, weighing less than one pound, produces a uniform feed pressure on the blade of 175 lbs. Any feed pressure can be had instantly by manipulating the feed lever, yet the feed has the same action as gravity.

The saw frame on the PEERLESS can never drop in case the blade breaks which often causes great damage to the machine. Neither can the saw frame drop on to the work and break the blade in case the machine is started before lowering the frame. The saw frame automatically raises when cut is finished, which saves the operator handling a heavy cumbersome weighted saw frame.

The PEERLESS is fool proof in construction, and a boy can operate it with one hand.

"FULFLO" MACHINE TOOL Lubricant PUMP

You can drive your machines faster

but your cutting tools won't stand it — the speed burns them up.

A cutting tool will stand up to higher speed and heavier feeds, providing it is kept cool.

The "FULFLO" Machine Tool Lubricant Pump supplies a good "HEAVY" stream of compound sufficient to carry away all the heat.

No gears or other close-fitting parts to be affected by the grit, dirt, or small chips that are always present in the coolant. No clogging.

The only working part is the impellor. Since no check valve, reverse valve or any other kind of valve is present in the pump or pipe, other than the stop cock, the usual valve troubles are eliminated.

Easily attached to any machine. **Insist that the new machines you buy be equipped with the "FULFLO."**

--Good Files Promote Efficiency

You cannot get away from the fact that when a man is working with a good tool his pride in his work increases. A file worn smooth irritates the most even-tempered workman, while the high-strung, skilled mechanic who works with a bad file for half an hour costs his employer more in wasted mental and physical energy than possibly a dozen files may cost him—in the final results.

Educate your men to throw away their files when they reach their "inefficient point." It is economy. It is efficiency. It promotes good temper at the bench.

Oxy-Acetylene Welding and Cutting

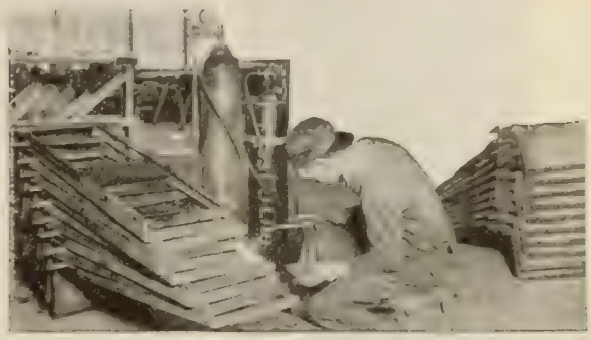

Illustration shows operator welding the corners on steel truck frames, using the Prest-O-Lite Process.

Prest-O-Lite Process Welding Speeds Up Production

By welding the corners on the frames of a series of trucks a number of welds are made without moving the welding outfit. When this pile is completed, the apparatus is quickly and easily moved to another pile similarly arranged.

This is a typical example of how oxy-acetylene welding is simplifying and lowering costs in manufacturing operations. **Better than complicated and expensive riveting and threading.** Hundreds of other routine manufacturing operations are handled better and at lower cost by oxy-acetylene welding.

You secure all the advantages of welding in the simplest, most efficient and most economical form by adopting the

Prest-O-Lite PROCESS

Employs both gases (acetylene and oxygen) in **portable cylinders. Prest-O-Lite Dissolved Acetylene** (ready-made gas) is backed by Prest-O-Lite Service, **which provides dry, purified gas, insuring better** welds, quicker work, and lower cost, and also avoids **the large initial outlay and heavy depreciation in**curred in making crude acetylene in a carbide generator.

Necessary equipment is not expensive. We furnish high-grade welding apparatus for $75; acetylene service at additional cost. Adaptable for oxy-acetylene cutting by the addition of special cutting blow-pipe. Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene any average workman who understands metals can learn the process quickly and easily

The Prest-O-Lite Literature is thoroughly illustrated, and is full of helpful suggestions to progressive manufacturers designing and production engineers. **Ask for it.**

Hydraulic Press

FOR SHELL BANDING

Simple, Strong, Reliable, Low Cost

Power is obtained from continuous running belt-driven pump located near the press and is applied to the ram underneath the table.

Table Rises and Forces Steel Taper Wedges, eight in number, up into the Hollow Steel Forging at the top, the wedges conforming to the shape of the shell and are thus pressed in equally against the copper band; pressure is then released, the shell is readily taken out.

Operates by lever shown on the left-hand side. Pressure gauge behind.

As this machine is a standard Hydraulic Press, it can be used in any other capacity.

SEE OUR BIG TIME AND LABOR-SAVING ELEVATING TRUCK in next week's ad. It is proving indispensable everywhere.

We also manufacture **Loading Funnels, Ball-Bearing Tightening Nuts, Belt-Driven Loading Vibrators, Bench Vises.**

We shall be pleased to submit prices and give any particulars required.

Elmes Hydraulic Press No. 676

With ¾-in. Automatic Lever Operating Valve No. 677-A

This press is of steel and semi-steel construction, and the stands which support the press are threaded at the ends to receive the steel columns and have holes for fastening to the floor. The platen is guided by the columns.

The operating valve is attached to the cylinder, and is designed with a weight to be set for the pressure desired, and releases automatically. To start the ram up, the lever is pushed down; upon the ram reaching the desired pressure, the lever automatically releases (acting as a safety valve as well), causing the ram to descend. Valve body is made of bronze, and other parts are made of tool steel and machine steel. If desired a hydraulic gauge can be attached to show the various pressures, although with this valve it is not necessary.

Write for our Hydraulic Machinery Catalogue.

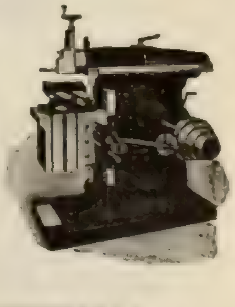
Cut Your Shop Costs



Nobody would think of putting 16-inch lathe work on a 30-inch lathe, then why leave small parts on a large Milling Machine?

A Steptoe Hand Miller or small power feed can be handled quickly and will cut your production cost. You will have less money invested in your Milling Machines and have more machines to do the work.

That same principle applied to your small planer work will cut the cost of planer work.

A Steptoe Shaper will do the work faster because it can be handled quicker.

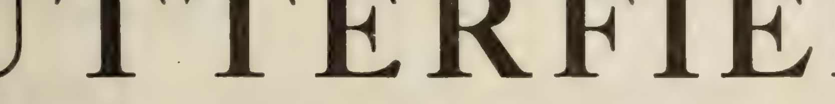
ROCK ISLAND, QUEBEC

Taps, Dies

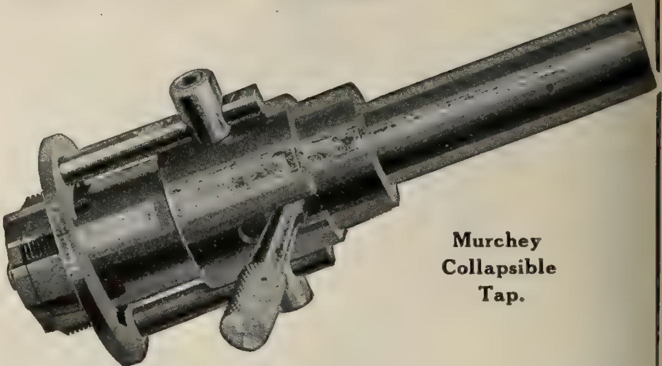


Reamers, Etc.

MURCHEY
TAPS AND DIES

—very extensively used on 6-in., 8-in. and 9.2-in. shells.

The great advantage of using MURCHEY COLLAPSING TAPS AND DIES on large shells



Murchey Collapsible Tap.

MURCHEY Taps and Dies save the buying of extra machines. The time alone required to thread one of the large shells, together with rehandling, will more than pay for the tap in a very short time.

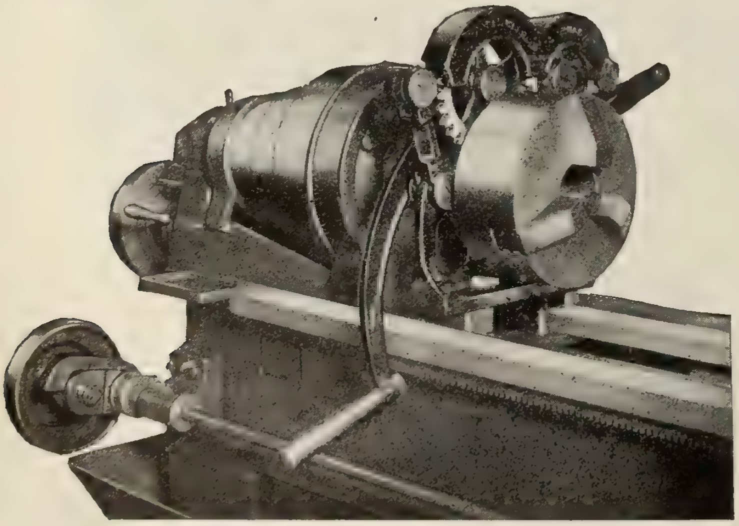
The largest American firms are doing all the threading on shells with Murchey Collapsing Taps and Murchey Self-opening Dies, and are getting most desirable results.

They save the time of rechucking and rehandling, the possibility of the shell getting out of center. By using a roughing and finishing tap they are able to tap the base and nose of these shells in about one-fifth of the time it requires on a thread miller and produce accurate work.

Send us Blue Prints of your requirements and we'll gladly quote you on the necessary tools.

Murchey Machine & Tool Company
75 Porter Street, Detroit, Mich.

Speed Up! Production
With a Barker Wrenchless Chuck



You don't consider money spent, on som thing which will bring returns—it is ir vested.

A chuck which will cut the time of settin up in half and at the same time not be pr hibitive in initial cost or maintenance is most worth-while investment in your pla —is it not?

Barker Wrenchless Chucks are proving their worth as investment in many plants where multiple chucking h been a profitless bugaboo—perhaps your neighbor is Barker fan—let us send you a list of users in your ter tory.

An inquiry to-day will bring the Barker proposition to y by return mail. You can't go wrong and you do not ob gate yourself in any way whatsoever.

The entire opening and closing operation is accomplished with a short action of the hand lever—think what this means in saving of time.

What 1-1000 Inch Means in Tons Pressure

IN fitting any press-on job, the amount of pressure is the limiting factor. The specifications call for a certain pressure. A variation of 1-1000 of an inch means a variation of tons of pressure and a return of the job to the lathe for refitting. Accuracy in measuring forced fits saves much in shop costs and adds to the value of the workman. The machinist who uses

TRADE MARK

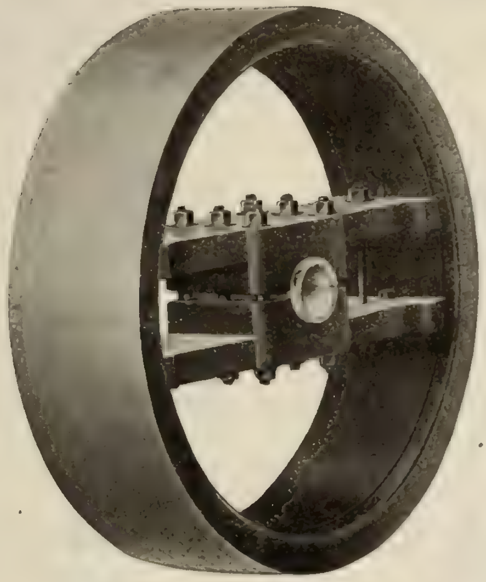
PULLEYS

No Keys

No Set Screws

In Perfect Balance



Lighter

Stronger

Better Belt Surface

The Dodge Standard Wood Split Pulley

The Wood Split Pulley is better than either cast iron split pulleys or steel split pulleys for the following reasons—

The wood pulley is lighter, stronger, better balanced, and provides a very much better belt surface. It costs 33 1-3% less money and provides 50% more returns in horse-power value. It may be run at very much higher speeds with no danger of bursting—also it may be had quicker and in a greater range of sizes.

It costs less to get—less to put on—and less to keep.

We make approximately 300 Dodge pulleys every day—everybody uses them.

There are more Dodge pulleys making ammunition than any other kind—you can get them quick.

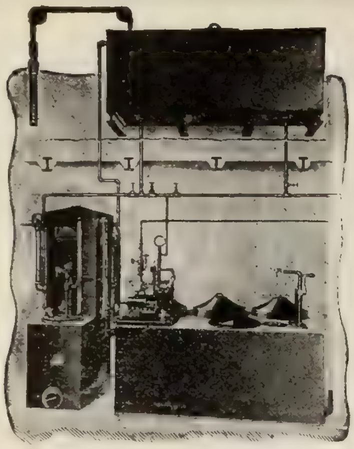
Every pulley is thoroughly nailed. Every pulley is guaranteed for Double Belts.

We are Canada's greatest pulley makers.

If you have not our Books, write us.

DODGE MANUFACTURING COMPANY

Toronto - - Montreal



Is Your Plant "Oil" Right

A *Bowser Oil Filtering System* is BOWSER-made throughout. BOWSER-made Filter. BOWSER-made Fittings. BOWSER-made Pump. BOWSER-made Castings. No divided responsibility—hence our blanket guarantee.

A BOWSER ESTABLISHED 1885 Oil Filtering and Circulating System

Will cut your oil bill 65% or more. Will reduce the fire hazard to a minimum. Will promote cleanliness throughout the plant. Will mechanically do its work 24 hours a day, 365 days in the year, better than it is possible to do it by hand.

We manufacture Oil Filtering and Circulating Systems with capacities from five gallons to 7,000 gallons per day. All built upon the dry system of filtration. There is a Bowser System to meet your requirements. Over a million in use.

Our Engineering Department is acknowledged as the foremost authority on subjects pertaining to the storing and handling of oils of all kinds.

S. F. Bowser & Company, Inc., Toronto, Ont.

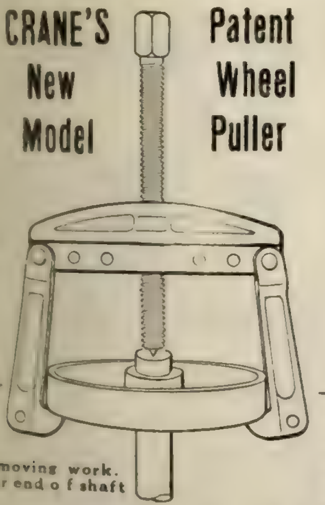
CRANE'S New Model



Patent Wheel Puller

Removing work. near end o f shaft

For Removing

Transmission and Cam Shaft Gears, Auto Wheels, Fly-Wheels, Sprockets, Collars, Couplings, Propellers, Universal Joints.

For straightening Shaft, Bending Pipe, etc.

The Screw has a flat end with inserted tempered tool steel point that will not spread centres. Makes its own centre on work that has none. The strain is taken on the flat end of the screw. Grease to keep from cutting. The screws are made of high carbon steel and case-hardened all over. All Pullers are furnished with two sets of new combination hook extension arms.

The Pipe Bending Attachment is indispensible in a repair shop for straightening propeller and jack shafts, bending exhaust pipes, and removing universal joint yokes, etc. **Drop a line for full particulars.**

54 Lake St., Arlington, Mass., U.S.A.

Canadian Distributors: Canadian Fairbanks-Morse Co., Montreal, Toronto, Vancouver, Winnipeg, St. John, Calgary. John Millen & Son, Montreal, Toronto, Winnipeg, Vancouver.

Tighten the Grip of the Main Belt

This cork inset pulley in every other respect exactly like the standard, smooth-faced American Steel Split Pulley—insures absolute grip at that "one time out of a thousand" when other pulleys **might** slip.

It is made to take the load of the main drive belt and transmit **all of it.** So the cork insets are put in. They **hold** the belt. It **can't** slip. The belt would tear first.

The insets will wear almost as long as the pulley.

These pulleys have been on the market several years, and we don't know of any that have actually **worn out** in service.

AMERICAN STEEL SPLIT PULLEY —with Cork Insets

Over 60,000 pulleys—3 inches to 120 inches in diameter—stocked at centres named below, and additional thousands stocked by over 200 dealers insure prompt deliveries. Write for quotations and delivery dates.

FAIRBANKS-MORSE SHELL LATHES

WE have designed this machine to meet the demand for a plain, heavy standard lathe, void of frills, which can be easily handled by non-skilled labor. It is particularly suitable for various operations on High Explosive Shells. The quality of the material used throughout its construction is the very best obtainable and the workmanship is up to the standard required.

The gearing is of steel cut from the solid. Headstock bearings are fitted with brass bushings and ring oiled. Spindle is bored for No. 5 Morse taper center, and will be solid unless otherwise ordered. Three changes of feed are obtainable by means of shifting lever in gear box and feeds of 1-8, 1-16 and 1-32 inch will be furnished.

The countershaft is a heavy, durable two-speed countershaft, having two 16 x 6 friction driving pulleys and a cone pulley. The carriage will be provided with power longitudinal feed, having automatic stop in both directions. Hand cross feed. The headstock, tailstock, carriage and apron are massive, at the same time not clumsy. We can also furnish lathe, with various attachments for different operations, at additional cost.

16-in. Fairbanks-Morse Lathe

Specifications

CANADA'S DEPARTMENTAL HOUSE FOR MECHANICAL GOODS

Some Scientific Aspects of Steel Founding Practice*

By W. A. Naish, A.R.S.M., A.I.M.M.

The following resumé of facts concerning steel is not put forward as representing new information, but rather with the idea of its being somewhat of an educational message to foundrymen and metal-working operatives whose sphere of activity does not permit of their becoming familiar with the essentials of steel production in specially equipped plants.

UNDER the name "Steel" are now included so many varieties of iron that it is impossible to give a good definition of the term. Until the introduction of mild steel, the term steel was always defined as being iron containing from 0.5 per cent. to 1.5 per cent. carbon, with small quantities of other impurities, and which, when heated and quenched in water, became sensibly harder. Now, however, we have steels containing much less than 0.5 per cent. of carbon, and which do not sensibly harden on quenching. A definition now perhaps more accurate is "any form of iron other than malleable iron, containing 2 per cent. of carbon or less, with small amounts of other impurities."

Classification.

There are many classifications, the most general, perhaps, being "hard steel" and "mild steel," the dividing line being taken at about 0.5 per cent. carbon. The two forms pass gradually into one another, and the hardening on quenching becomes less as the percentage of carbon decreases. Another classification is "high," "medium" and "low carbon steels." The high-carbon steels are used for tools, and the low-carbon for structural purposes.

Another classification is based on the method of manufacture:—(a)—Puddled steel, made from pig-iron which has not been fused, but welded up from a pasty mass. (b)—Cement steel, made from malleable iron. (c)—Crucible cast steel. (d)—Bessemer steel. (e)—Open-hearth steel. (f)—Basic steel. The American Society of Mechanic Engineers in 1876 introduced the terms:—Weld iron, weld steel, ingot iron, ingot steel.

Chemical Composition of Steel.

Steel is essentially a compound of iron and carbon, other constituents being regarded as accidental impurities, except in so far as they are introduced to confer special properties.

Carbon—The carbon content of a steel may vary between 0.1 per cent. and [illegible] per cent. or more. The grade of the steel is usually determined by the quantity of carbon present. Graphitic carbon is never present except, perhaps, occasionally in high-carbon steels. A variety of uncombined carbon known as graphitic temper carbon sometimes separates when high-carbon steels are slowly cooled. The combined carbon exists in at least two forms:—(a)—As a definite carbide disseminated through the metal called "carbide carbon." (b)—Distributed evenly through the mass either in combination with the whole of the iron, or in solution with it. This variety is chiefly present in hardened steel, and is called "temper carbon."

Silicon.—The general effect of this constituent is to harden and strengthen the steel, but to a much less extent than carbon. Turner says that "the increased strength due to 0.2 per cent. silicon is about 1.8 tons." Campbell states that "silicon cannot be classed among the highly injurious elements, and small quantities cannot exert a very deleterious effect, but when the percentage is very high the metal becomes very hard and brittle."

Phosphorus is universally regarded as the greatest enemy of the steelmaker. Up to 0.1 per cent. it increases the tensile strength, but if the metal is subjected to shock it is liable to break readily. The effect of phosphorus seems to be greater in higher-carbon than in low-carbon steels. It produces a typical coarsely-crystalline structure and it lowers the maximum temperature to which the steel may be heated in working.

Sulphur produces "red shortness" and gives a coarsely-crystalline fracture. The metal also tends to crack during rolling and welds badly. If manganese is present in the steel a larger quantity of sulphur is permissible.

Manganese counteracts the effect of sulphur, increases the tensile strength, but also increases the tendency to crack when suddenly cooled. Up to 1 per cent. it has little injurious effect on mild steel, but in larger quantities it tends to make the metal brittle under shock. The effects of nickel, tungsten, chromium, etc., are briefly considered under "Special Steels" later. The compositions of high-, medium- and low-carbon steels are as follows:—

	High carbon %	Medium carbon %	Low carbon %
Carbon	1.2	0.5	0.15
Silicon	0.29	0.2	0.08
Sulphur	0.01	0.04	0.03
Phosphorus	0.01	0.04	0.03
Manganese	1.0	0.85	0.4

Methods of Steel Making.

The method of making steel directly from the ore is now obsolete except in the special case of the Stassano electric furnace. The process of steel-making from malleable iron is one of cementation, and depends upon the fact that if bar iron is heated for a long time at a welding temperature in contact with carbon the latter travels into the iron and the metal becomes carburised. We have to account for two changes in the material: (a) The transmission of the carbon into the iron. (b)—The formation of "blisters."

There probably is a very slow diffusion of the solid carbon into the iron, but the usually accepted theory is that at the high temperature, and in the presence of excess of carbon, carbon monoxide is produced, $C + O = CO$. This penetrates into the pores of the iron, and is decomposed on contact, carbon being deposited, and carbon dioxide being produced $2CO = CO_2 + O$. This carbon dioxide diffuses out, and is reconverted into carbon monoxide. At welding temperature the carbon combines with the iron, and steel is produced. The "blisters" are probably due to the presence of minute specks of solid impurities, such as oxide of iron. Carbon is deposited in contact with these, carbon monoxide is evolved, and the oxide reduced, the gas attempts to diffuse, and if near the surface the metal cannot resist the pressure and a "blister" is formed.

Crucible Cast Steel.

The process of making crucible cast steel is essentially one of melting, but certain chemical changes also take place. There is always some oxide of iron in the metal and air in the pot, therefore, there is at first, at any rate, a basic silicate formed. As the action proceeds this becomes more and more acid. The composition of the metal may change somewhat, as it will pick up a little silicon from the pot and carbon from the fuel; also the mere fact of the metal being molten for some time will give opportunity for a slight oxidising out of carbon and silicon. The presence of manganese tends to prevent the removal of silicon by oxidising first, and thus using up the available oxygen. The result of melting, then, is almost always to increase the percentage of carbon and silicon and to reduce the manganese. The amount of sulphur also increases slightly, either from the pyrites in the clay or from the furnace gases.

---

*From a paper read before the London Branch of the British Foundrymen's Association.

As is well known, the freshly-melted metal teems fiery and yields an unsound casting, due to evolution of gas during cooling. The "killed" metal teems quietly. According to Howe, killing probably acts chiefly by enabling the metal to absorb silicon from the walls of the crucible, thus increasing its solvent power for gas and enabling it to retain in solution during solidification the gas which it occludes when molten. The common belief is that killing expels the gas present, so that less remains to escape on pouring; but we find that silicon is rapidly absorbed during killing, and when conditions are such that the metal cannot absorb silicon, holding the metal molten does not kill.

The production of sound castings by "medicines," automatic stirring and by presses is briefly discussed later under "Casting of Steel." The most generally used "medicines" or improvers for steel are manganese peroxide, common salt, salammoniac, fluorspar, potassium chlorate, and, in the case of large ingots, aluminium and silicon. The processes of making steel from pig-iron may next be considered.

Acid Bessemer Process.

The theory of this process is the oxidising out of the impurities by blowing air through the molten metal. The plant is well known. The removal of carbon commences immediately, also silicon is similarly removed, but in the acid process sulphur and phosphorus are not removed. This fact makes it impossible to use a phosphoric iron in this process. The percentage of silicon must be at least 2.25 to 2.5 per cent., as it is the principal source of heat during the operation; but at the same time it should not exceed 3 per cent., as the metal may become too hot and too much iron may be carried away as silicate of iron. A suitable pig would be:—Graphitic carbon, 3.42 per cent.; combined carbon, 0.46 per cent.; silicon, 2.5 per cent.; sulphur, 0.05 per cent.; phosphorus, 0.03 per cent.; manganese, 0.5 per cent. Recarburising by means of spiegel for ferro-manganese fulfils two purposes:—(1)—Adding the requisite amount of carbon. (2)—Improving the metal by removing occluded oxygen.

Basic Bessemer Process.

As mentioned above, the acid process will not remove phosphorus. In order to do this, a basic lining is necessary, and lime is also thrown into the converter. Phosphorus is very little removed until the carbon has gone, that is, during the "after blow." The phosphorus is removed as calcium phosphate in the slag, and an important point is that the basic slag must be poured off before recarburising, or some of the phosphorus will be reduced back again, and re-enter the iron. It is the phosphorus which provides the heat of reaction in the basic process, and the silicon should be low. A suitable pig would be:—Graphitic carbon, 0.82 per cent.; combined carbon, 2.83 per cent.; silicon, 0.63 per cent.; sulphur, 0.07 per cent.; phosphorus, 2.75 per cent.; manganese, 1 per cent. The steel can be made milder than in the acid process, but it is not considered so reliable by some engineers.

As a passing reference to the modification of the Bessemer process, such as the Clapp-Griffiths, the Tropenas, Walrand-Roberts and the Swedish, it may be said the chief difference is merely that of alteration in size and shape of the converter and the matters of side versus bottom blowing, and fixed versus rotating vessels. Small converters can never become general, but at the same time there are obviously cases where their use is advantageous. There is an increased loss of 4 per cent. in side blowing, and less uniform mixing of the metal. As to fixed converters, the time is longer, as the charge must be tapped. They do not permit of bottom blowing, and it is impossible to recarburise in the converter.

Open-Hearth Process.

In this process the oxidising out of the impurities is effected by means of oxide of iron. Recarburising is effected by means of ferro-manganese or carbon (the Darby process). As in the Bessemer process, the phosphorus is not removed in the acid open-hearth. In the basic process lime is added, and the lining is of dolomite, but it is not necessary to use basic bricks above the slag line. As the source of heat is external, the amount of silicon and phosphorus is not so important as in the Bessemer process.

The modifications of the open-hearth process are chiefly mechanical. The Wellman and Campbell tilting furnaces ensure, amongst other things, quicker working. The Bertrand-Thiel process consists of working two furnaces together, nearly purifying in the "primary," and finishing off in the "secondary" furnace. The Talbot process is a continuous one, part of the finished charge being tapped and fresh pig added.

The removal of sulphur by the Saniter process is effected by bringing molten steel into contact with lime and calcium sulphide, whether in the furnace or in the ladle, the sulphur passing into the slag as calcium sulphide. Sulphur is also removed to a certain extent by the use of a mixer, which may be regarded as a reservoir for molten metal previous to steel making.

Electric Smelting.

Extravagant claims have been made for electric smelting, but there is no doubt that high-class steel can be made and cheap materials used, as phosphorus, sulphur, etc., are removed to a trace. Probably it will come into operation for refining materials, and in connection with open-hearth and Bessemer steel. Electric furnaces are used for making high-class steel from pure materials and from rail ends and scrap; for making special steels from open-hearth and Bessemer steel; for making ferro-chrome and ferro-silicon; for the direct production of steel from ore.

The high quality of the steel produced by electric smelting is probably due to the absence of occluded gases, the absence of over-oxidation and less segregation. Steels of highest quality, equal to the best crucible steel, can be made at a lower cost. For special steels for guns it can compete with the open-hearth furnace. For ordinary rail or structural steel it is too costly unless water-power is available. It is highly recommended for refining Bessemer and open-hearth metal. If molten metal is used, the extra cost over the open-hearth is small, and is more than compensated by the low price of the materials used.

Casting of Steel.

In the casting of steel there are four defects to be considered:—

(1) Blowholes.—These are due to occluded gases, carbon monoxide, hydrogen and nitrogen produced from the moisture in the air and in the materials, oxygen from the air, carbon and the constituents of the air itself. These gases cannot completely escape and are mechanically entangled in the pasty metal. An approximate analysis of a gas of this nature is as follows:—Carbon dioxide, 0.48 per cent.; hydrogen, 49.8 per cent.; carbon monoxide, 48.23 per cent.; methane, 0.40 per cent.; nitrogen, 1.40 per cent.

It is a known fact that steels of practically the same composition vary greatly in hardness, tensile strength, etc., when manufactured in different ways. This may possibly be attributable to the presence of nitrogen. Nitrogen is particularly injurious to special steels. Nitrogen and oxygen tend to produce blowholes, and sometimes they produce a peculiar kind of brittleness, due to pickling. This can be removed by annealing. The deleterious effect of these gases should be more widely recognised

(2) Piping.—This is due to the solidification of the metal nearest the side o the mold, and its consequent contraction. The pipe is formed as an interna

cavity, usually at the top of the ingot.

(3) Segregation. By segregation is meant the separation of the metal into portions of different composition during solidification. Steel is not a definite chemical compound, and therefore the less fusible constituents solidify first. There is a tendency for pure or nearly pure iron to separate first. In ordinary ingot casting the segregation is not large. In a plate ingot 10 in. thick the carbon may vary from 0.18 per cent. at the top to 0.15 per cent. three inches from the bottom, and the phosphorus from 0.075 per cent. to 0.058 per cent. in the same limits.

(4) Cracks. These are produced by the expansion of the mold and its drawing away from the metal. If not sufficiently plastic to follow, the metal will crack. The unequal contraction of the external and the internal portions of the ingot may also produce a fracture.

Prevention of Defects in Cast Steel.

Mechanical Pressure. This involves the use of a press, such as the Whitworth, Illingsworth, or Harmet. In these the contraction of the metal is followed up. It is really casting under pressure.

Agitation and Centrifugal Force is another method which has been tried.

Chemical Methods.—The two substances usually employed to prevent defects are aluminum and silicon. The action of silicon is very marked, and entirely removes blowholes, the explanation probably being the same as that given under "killing" of crucible cast steel. The action of aluminum is quite as marked, but the rationale of the action is less understood. It may be due to the fact that aluminium removes oxygen, and as oxygen diminishes the solubility of the gases in iron, the aluminium may thus indirectly raise the solvent power.

Special Molds.—The principle involved in the use of special molds to prevent the defects mentioned is to make the lower 70 to 80 per cent. of the mold thicker, and therefore of greater heat absorptive capacity than the upper 30 per cent.

Special Steels.

There has been a great advance made of late years in the manufacture of special steels. The following notes relate to the effects of the special constituents introduced:

Nickel Steel.—The tensile strength increases with the percentage of nickel. Thus 0.3 per cent. nickel gives a tensile strength of 31 tons, whilst with 11.4 per cent. it is 65 tons. The elastic limit increases more rapidly than the ultimate strength. Nickel steel has a high vibrating strength, and is more rigid and tough than ordinary carbon steels. The recalescence point is lower, the annealing temperature is lower, and the metal hardens when quenched from a lower temperature. It resists corrosion, and possesses a high electrical resistance. It loses its magnetism when heated, but regains it when cooled. Nickel 3.5 per cent. has about the same effect on tensile strength as 0.2 per cent. carbon. Other constituents being constant, 0.8 per cent. and from 3 to 5 per cent. nickel gives a good tool steel.

Manganese Steel.—The effect of manganese is to harden the metal as the percentage of manganese increases. Up to about 5 per cent. manganese the metal is very hard, while over 7.5 per cent. it becomes hard and tough. Hadfield's manganese steel has a tensile strength of 67 tons, and the metal is ductile. The electrical resistance is very high, and it is non-magnetisable.

Chrome Steel.—The chief property that chromium confers on steel is that of hardness; hence its use in armour plate and projectiles. Five per cent. chromium will give a tensile strength of 74 tons unannealed .

Tungsten Steel.—Tungsten makes the steel intensely hard, and this hardness is not reduced by slow cooling. Tungsten steels are not hardened by heating and quenching, hence the name, "self-hardening steels." These steels are much in favour as tool steels. An average composition is 1.5 per cent. carbon and from 6 per cent. to 9 per cent. tungsten, although lower percentages are now common. Under this heading may be mentioned a special steel the composition of which is as follows:—Carbon, 0.55 per cent.; chromium, 3.5 per cent.; tungsten, 13.5 per cent.

Molybdenum and Vanadium are used in special steels, the latter especially in some American tool steels. They have a still greater proportionate effect than those elements mentioned previously. A typical analysis of an American molybdenum steel is:—Molybdenum, 9.65 per cent.; carbon, 0.66 per cent.; manganese, 0.22 per cent.; phosphorus, 0.02 per cent; silicon, 0.05 per cent. Many molybdenum steels have a lower percentage of Mo. From 0.5 to 3 per cent. of molybdenum in a high tungsten steel slightly increases the cutting efficiency.

Vanadium Steel.—Vanadium raises the elastic limit and tensile strength, but slightly reduces elongation; 0.2 per cent. vanadium added to a low-carbon steel raises the elastic limit and tensile strength 50 per cent. or more. This steel is valuable for engine parts and details subjected to alternating stress. It hammers and welds well. A steel containing 0.24 per cent. carbon, 0.28 per cent. vanadium, and 3.38 per cent. nickel gave the following results:—Elastic limit, 50.3 tons; tensile strength, 68.2 tons; elongation, 17 per cent.

It must be pointed out that the foregoing figures are general and are much affected by the percentage of carbon and by the heat treatment.

Hardening of Steel.

When a steel containing more than about 0.2 per cent carbon is heated to redness and quenched it becomes hard. The degree of hardness depends on the rapidity of the cooling, temperature of cooling and percentage of carbon. The changes observable are:—Pure iron heated to about 900 deg. C. and cooled slowly shows three distinct retardations, viz., at 825 deg. C. (Ar$_3$); 720 deg. C. (Ar$_2$); and 650 deg. C. (Ar$_1$). If much carbon is present there is only one point discernible, viz., at 670 deg. C. (Ar.$_1$). If iron is heated, three corresponding points are got, about 30 deg. C. above the Ar points, namely, Ac$_1$, and Ac$_2$, and Ac$_3$. The retardation at Ar$_1$, is accompanied by a change in the condition of the carbon from hardening carbon as it exists in hardened steels to cement carbon (Fe_3C), which is present in normal and annealed steels. To convert cement carbon into hardening carbon it is necessary to heat above the critical Ac$_1$.

If the steel is heated above Ac$_1$ (700 deg. C. for 12 per cent. steel), and quenched, the carbon is retained as hardening carbon. When a steel is heated to AC$_1$ and quickly or slowly cooled, the finest grain it is capable of assuming is produced. If heated above Ac$_1$ the grain becomes coarser and coarser. The best temperature to quench from is that temperature which gives the finest grain and the greatest strength, and this depends on the percentage of carbon.

Annealing.

The object of annealing is to diminish the abnormal qualities the metal acquires through hardening and mechanical working. The metal should be annealed by heating to the Ac$_1$, critical temperature, and keeping at that temperature a sufficient time to change a certain amount of the hardening carbon into cement carbon or the hard into the soft allotropic variety of iron. It is immaterial whether it is quickly or slowly cooled. The heating should be slow, and the steel throughout the operation should be shut off practically from the air. The time occupied in actual practice is variable, and whilst there can be no doubt that excessive annealing does no good, and may do harm, a good proportion of the unsatisfactory steel castings is accounted for by erring on the other side.

The typical structure of a normalised steel of 0.5 per cent. carbon consists of ferrite and pearlite. (Pearlite is Fe_3C. in intimate association with Fe and contains 0.9 per cent. carbon.) The amount of each constituent depends on the percentage of carbon. The structure is typical of a mild steel, which after being heated to full redness is allowed to cool in the air. A saturated steel contains 0.9 per cent. carbon, and the structure is all pearlite. As the percentage of carbon increases beyond this point, a new constituent appears, viz., cementite, Fe_3C., which is typical of super-saturated steels.

In a hardened steel there occurs a new constituent, hardenite, accompanied by ferrite in mild steel, and cementite in super-saturated steels. Hardenite is probably pearlite altered by heating and quenching. If a steel is suddenly quenched from 1,000 deg. C. the typical needle structure of martensite is got. Annealed steels show the granular pearlite altered into parallel layers. This banded structure is true pearlite and is typical of slowly-cooled steels.

Defects Produced by Hardening.

Water Cracks.—These are the direct result of enormous stresses produced by contraction. The only remedy is to exercise the greatest care and to have a good quality steel. The steel should be low in phosphorus and manganese; 0.025 per cent. phosphorus is permissible, 0.4 to 0.5 per cent. manganese in mild steel, and 0.2 per cent. manganese in 1 per cent. carbon steels. The whole of the tool should be at a uniform temperature, and the temperature should be the correct one for the percentage of carbon present.

Special Methods of Hardening.

The Barium Chloride Bath is used for taps, etc. The bath is heated to 1,200 deg. C. by gas, and the tool is soaked for a few minutes only, so as to heat up the edges. The tool should then be withdrawn. Electric Furnace methods employ as the heating medium barium chloride for high-speed steels, barium chloride and potassium chloride for carbon steels, and sodium chloride and potassium chloride for lower temperatures. The current is alternating, and iron electrodes are used. The table given below may be interesting to show the effect of annealing and hardening and tempering on gun steel of different carbon contents:—

	Unannealed		Annealed	
Carbon %	Tensile strength Tons	Elongation %	Tensile strength Tons	Elongation %
0.37	28	8.2	36.7	21.8
0.5	44.4	2.0	44.0	12.0

	Annealed			Hardened and Tempered		
Carbon %	Tensile strength Tons	Elastic limit Tons	Elongation %	Tensile strength Tons	Elastic limit Tons	Elongation %
0.35	34.4	17.6	27.0	48.9	29.1	16.5

Case Hardening.

The ordinary methods of case-hardening are too well known to need description, but perhaps one or two points may be of interest. The best carburising steels are those containing from 0.1 to 0.2 per cent. carbon. Manganese has the tendency to make the carburising surface brittle. The outer skin will usually come up to about 0.9 per cent carbon. As a general rule, anneal after carbonising to destroy crystallisation in the core. The limit for the requisite temperature during this operation is about 925 deg. C. Carbon begins to penetrate at about 700 deg. C.

There are many special case-hardening mixtures. Guillet used 60 parts of wood charcoal to 40 of barium carbonate. Heathcote mentions wood charcoal soaked in a 5 per cent. solution of sodium carbonate. The annealing of the castings should be at a cherry red. To ensure refining of grain, the heavy sections will require a longer time for annealing, but they may be cooled quickly if high-tensile strength and elastic limit is required.

POWER TRANSMISSION BY LEATHER BELTING

By R. T. Kent.

THE most satisfactory belt drive is that which will at all times transmit the necessary amount of power and at the same time cost the least for repairs and maintenance, and cause the least possible loss by machine shut-downs for the purpose of making belt repairs in working hours.

To have a satisfactory belt drive the following considerations must be taken into account when the drive is laid out: The conditions of use of the belt, whether it is readily accessible or not; the velocity at which the belt will travel; the arc of the pulley with which the belt is in contact; the tension per sq. in. of cross section under which it is first placed on the pulleys; the tension per square inch of cross section to which the belt may be allowed to fall in service before it is taken down and retightened.

PLACE OF SCIENCE IN EDUCATION

IN considering "The Place of Science in Education," Dr. J. A. Fleming, Professor of Electrical Engineering in University College, London, recently remarked that in some schools a great show is made with carpenters' or engineering workshops. "This," he said, "impresses parents and attracts boys with a mechanical turn of mind, but there is little or no real scientific training in it. The making of a model steam engine is an amusement for leisure hours or wet half-holidays, but is perfectly useless as a means of scientific education for boys. The school work should be confined to imparting a really practical and thorough knowledge of elementary principles of science.

"Of course, in all this the quality and kind of teaching given is the important factor. The mode in which a subject is taught is even of more importance than the subject itself. Chemistry can be so imperfectly taught as to be of little use as a mind-training. It is possible to give a very scientific lesson on a Greek verb, and also to give a lesson on an electrical machine which is not scientific teaching at all. Hence here, as elsewhere, the man counts for more than the machine or apparatus. Nevertheless, the good teacher is wasted unless he has the necessary appliances."

SMALL FIRMS AFTER THE WAR.

IN the course of a recent discussion before the Birmingham Section of the Institute of Metals on the "Future of the Metallurgical Industries," Professor T. Turner remarked that Birmingham was not a smelting centre; it was particularly a metal-using centre. There were in the city and district 20 metal workers to every one metal maker, and perhaps the proportion was much larger. The business had grown up from very small beginnings, the result being that at the present time there were in the city 350 brass-casting firms. The consequence of having so many had been that organization was defective; there had been a great deal of competition, and the amount of scientific knowledge and guidance had been nil. He could not recall a single firm in the Birmingham district that dealt in brass casting alone that had a scientific adviser or even an analyst.

In the future, he considered, big concerns would be the rule. The small firm could not make a big gun, nor undertake the manufacture of aeroplanes nor the construction of a battleship There would be a combination of the small firms, or they would be squeezed out. It must be through big firms tha some of the work that was absolutely essential for the country would be done and it was firms like those that could afford to pay adequate salaries to thei officials, obtain scientific advice, and conduct researches. It was by the combination of organization and scientifi knowledge that success could be obtained. It seemed to him we must provid for the smaller firms, for, if we did not obviously we could not have the bi firms. The smaller firms would pay attention to specialties, but it would b by big firms that the greater part of th work of the nation would be done.

Machine Tool Building in a General Manufacturing Plant

Staff Article

The past two years have been full of opportunities for the machine shop proprietor, but in order to derive the full benefit it has been necessary to fore-see to a great extent just what the impending requirements of the situation would be. The successive manner, in which the types of machines referred to have been produced, bears evidence of that wide knowledge of supply and demand which is a pre-requisite to success in any line of business.

IN days to come, when the efforts of the Dominion are viewed with a true perspective, the value of the assistance rendered by the smaller machine shops to munitions manufacturers will become more apparent. There are few shops indeed throughout the country but what have been more or less affected by events, and while the nature of things pointed to large establishments with unlimited facilities and resources as the best ultimate producers of shells, it must not be forgotten that many of the special machines now assisting so ably in manufacturing the output of munitions were evolved and built by firms of more or less modest pretensions. One of the outstanding examples of this class is the Gray Mfg. & Machine Co., Toronto, who have up till now developed no less than four separate types of special shell machines and such supplementary apparatus as sand blast equipment, etc. Taken in order of evolution, these machines produced by this firm form an interesting record of the development of munitions machines, the order of their origination, and gradual growth in capacity paralleling the various developments of shell manufacture during the past eighteen months. The whole course of the firm's activity is evidence of close attention to, and careful analysis of the numerous problems of shell manufacture.

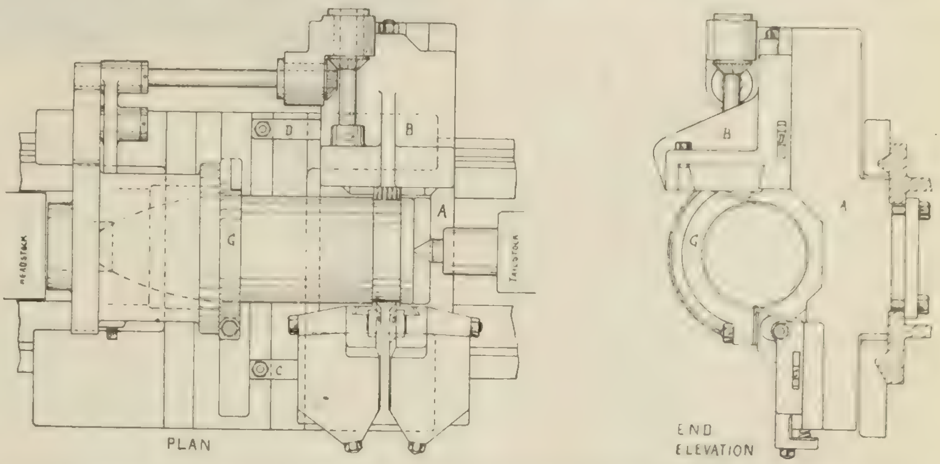

FIG. 2. DETAILS OF GROOVE FORMING ATTACHMENT FOR SPECIAL SHELL LATHE

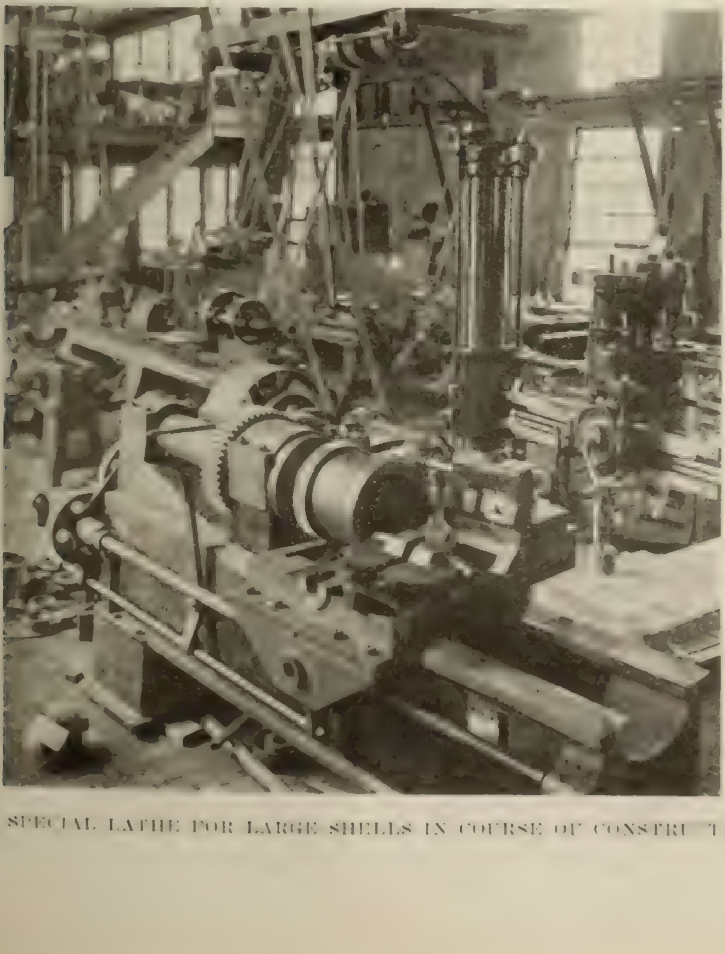

FIG. 1. SPECIAL LATHE FOR LARGE SHELLS IN COURSE OF CONSTRUCTION.

War-Time Product.

Commencing with cutting off machines and proceeding through the entire range of machining operations the attention of the firm was consecutively devoted to cutting-off machines, thread millers for small shells, thread millers for large shells, and a special shell lathe adapted to perform all the principal operations on shells up to 9.2 in. dia. By thus confining their activity principally to straight machine building, the immediate no less than the ultimate effect of their efforts, was of much greater benefit to munitions output than if actual shell making had been undertaken, especially at a time when machine tools were scarce.

With the gradual completion of equipment by shell shops, production of machines for preliminary operations has to some extent declined hence the present demand for later operation machines such as thread millers and lathes for various operations.

A Special Lathe.

The special shell lathe shown in course of construction in Fig. 1, is designed to handle large shells up to 9.2 in. diameter, and by means of various attachments will do work as follows: 1st., cut off and turn; 2nd, bore out the interior; 3rd., finish turn the parallel body and form the nose profile; 4th. band groove forming. The belt drive is direct from line shaft to a 20 in. dia. by 9 in. face pulley mounted on a friction clutch capable of transmitting 30 horse-power. Double reduction gears with a ratio of 9 to 1 transmit the power from the pulley shaft to the spindle, the spindle gear having 4-in. width of face and located directly behind the front bearing. The headstock is cast integral with the bed, and has adjustable babbitted bearings, the front one being 9½ in. diameter by 9½ in long and the rear 6 in. diameter by 8 in. long, sight feed oil cups being provided on both bearings.

The front way of the bed is of heavy Vee section, the rear way being flat, while the carriage is of liberal proportions and simple construction. The carriage is fed by a $1\frac{3}{4}$ in. 4 pitch screw working through a long nut in the apron and having a ball thrust bearing. Hand traverse is by handwheel in the centre of apron, this not being assembled yet in the illustration. At the far end of the feed screw may be seen a bracket projecting from the bed. An extension of the feed screw shaft is carried in this boss, and has mounted on it a clutch and pulley. The pulley is belted to the line shaft and the clutch which is operated by a sliding shaft and hand lever seen on front of the headstock, may be engaged alternatively with the pulley or the feed gear. In the case of the pulley, a quick return of the carriage to its starting position is obtained, the feed gear being inoperative during this time and until the clutch is engaged with it. The sliding clutch shaft is extended to the carriage and is provided with knock-out stops for automatically stopping the carriage travel at either end.

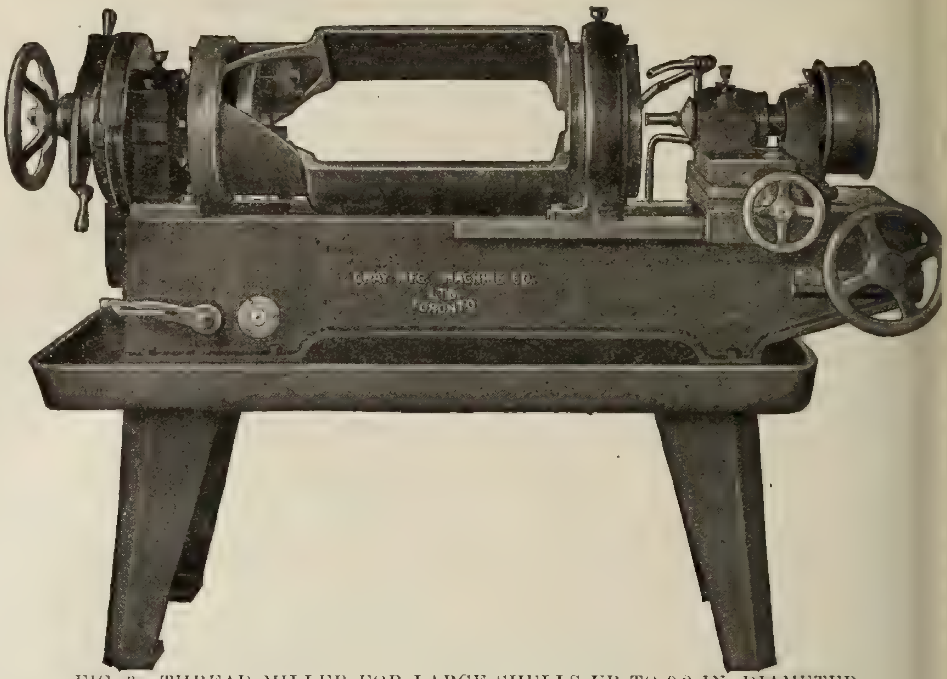

FIG. 3. THREAD MILLER FOR LARGE SHELLS UP TO 9.2 IN. DIAMETER.

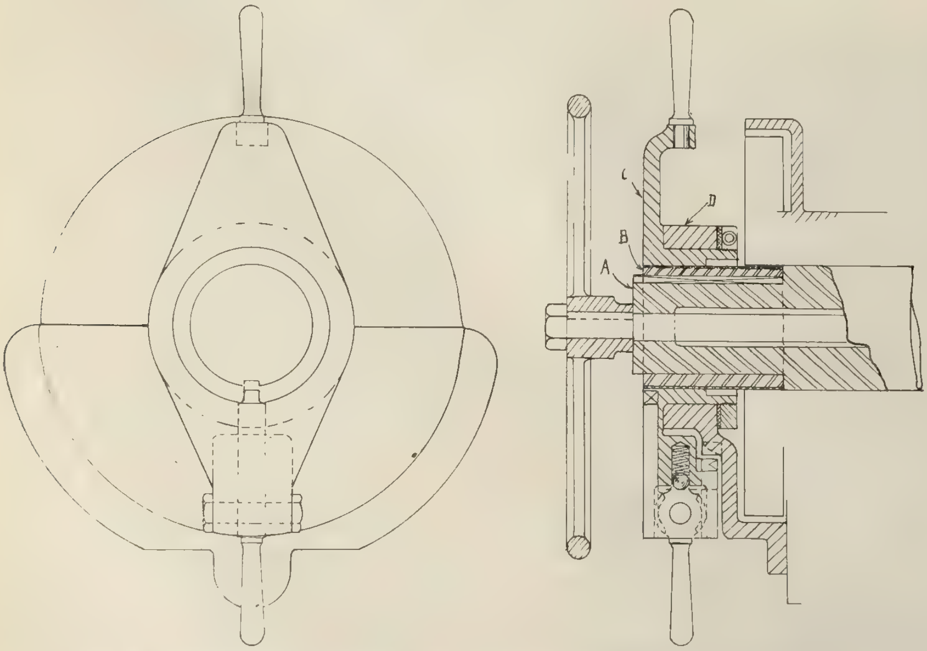

FIG. 4. DETAILS OF THREAD LEAD DEVICE ON THREAD MILLERS.

Variety of Equipment.

As already mentioned suitable equipment is provided for various operations. Thus for cutting off and rough turning the shell forging, a heavy duty tool rest of the European type is provided for the turning operation, while overarms, operated by a cam on the carriage carry the parting and facing tools. The shell is supported on an arbor and tail centre, being located from the inside of the base and driven by automatic dogs in the arbor.

When being bored, the shell is held in a suitable chuck while a turret with 24 in. diameter of base carries the boring bars, a sensitive hand feed with star wheel being provided.

Profile turning is accomplished by using two tool rests, one operating on the parallel portion while the other i controlled by a profile cam mounted o the back of the lathe bed, each tool being separately adjustable by a fee screw with graduated collar.

Grooving and Waving.

The band groove forming operatio is performed by the attachment show mounted on the bed in Fig. 1, and als in detail in Fig. 2. A stationary too carriage A is clamped to the bed, clearance on the underside allowing the regular carriage to approach closely. O the front of this stationary carriage ar two divergent slides carrying the under cutting tools, while at the rear is th waving tool reciprocating horizontall in a slide formed in bracket B, whic in turn is fed into the work along slide on the stationary carriage. Fee motion to the various tools is derive from cam rods C and D attached to sliding carriage.

A positive gear drive conveys motio from the spindle to the waving tool i the ratio of 8 reciprocations per revolution. The shell bodies, with the groov previously roughed out are inserted nos first in chuck F, the nose being centre in a spring supported socket or bushing while the outer end is supported b the tail centre. The spring allows th shell to be adjusted with the groov opposite the tools, being then driven b a floating driver G on the outer end o the chuck. The back end of the chuc has a gear rim, driving through gear and shafting as shown to the cam actuated block in slide B. The shafts ar feathered in the small level gears to allow longitudinal adjustment to all of th tools, and a liberal feed travel to th waning tool, independent adjustment o course being provided for each tool. A heavy tailstock of standard type with No. 5 Morse taper centre is part of the equipment which includes pump, gear covers, etc.

Thread Miller.

Illustrated in Fig. 3 is the larger of two designs of thread milling machines capable of handling all sizes of shells, sockets and plugs, up to 9.2 in. The larger machine as shown is equipped for threading 8 in. shells, and in common with the smaller machine it consists of a work carrying headstock with lead screw device for controlling the pitch of the thread, while the cutter-head is mounted on an adjustable carriage gibbed to the warp on the bed.

When it is considered desirable, as is frequently the case, to face the work in addition to threading, a cutter holder is mounted on the carriage in front of the milling cutter, the carriage then being used in the same way as an ordinary lathe carriage using the two handwheels for controlling the tool. By the addition of suitable chuck parts, this machine will thread bases as well as other parts.

In order to handle the large shells the construction of the spindle is as shown in Fig. 3. This consists of an extension which embraces the outer end of the shell and is supported in a suitable bearing, the other end resting in the rear bearing, on the outside of which is assembled the driving gear and the lead screw device. Underneath the headstock is located the driving gear which provides two separate speeds for milling and facing, the ratio being [illegible] to 1. Considerable interest attaches to these two devices the lead screw device being shown in Fig. 4 and the two-speed gear in Fig. 5.

Thread Lead Device.

Referring to the former, A is the tail end of the spindle on which is keyed a sleeve B, threaded on the outside to fit the threaded bore of yoke C. Yoke C is retained in position by bearing D attached to the end of the bed, a thrust washer and lock nut being provided as shown. When the yoke C is held stationary it acts as a nut, causing sleeve B and thereby the spindle to travel through and give a lead to the thread being milled in the work. If, however, it be desired to do facing on the work, the yoke C must be locked to the spindle and revolve with it, the thrust bearing referred to preventing any lengthwise movement of the spindle.

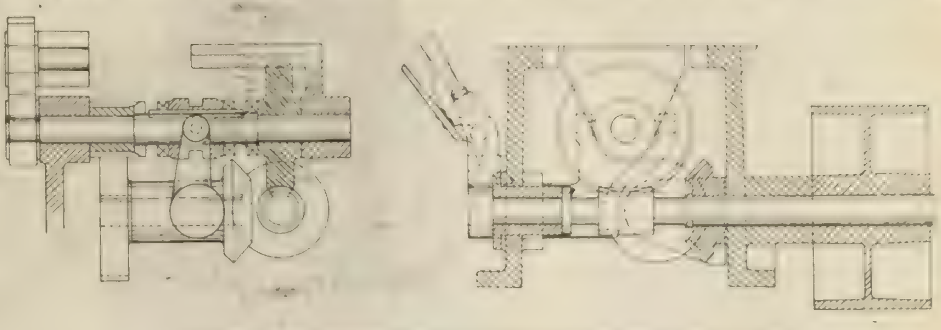

FIG. 5. TWO-SPEED GEAR DRIVE ON THREAD MILLERS.

The locking of the yoke as described is accomplished by the handle on the lower end. This handle is attached to a small gear, on opposite sides of which are two locking pins with rack portions meshing with the pinion. When moved to the right side the short pin engages with bearing D and holds the yoke stationary. When moved to the left side it disengages the short pin and engages the long pin with the sleeve thus locking the yoke to the sleeve. When in the neutral position, both pins are disengaged so that the yoke may be turned around backwards by hand and the spindle travelled along till the sleeve is backed through the yoke again. The length of travel provided on the sleeve is sufficient to allow of a considerable number of shells being threaded before returning the spindle to the starting point.

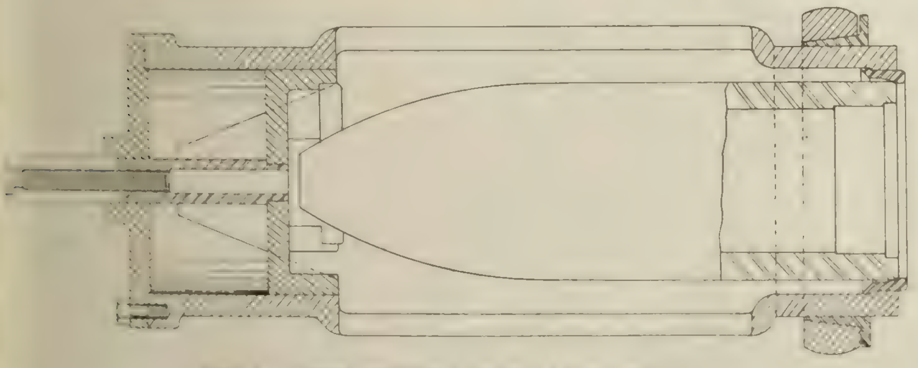

FIG. 6. OPEN SPINDLE FOR LARGE SHELLS

Two-Speed Spindle Drive.

The arrangement of the two speed gear is simple and compact and of substantial proportions for the work it has to perform. Fig. 5 shows the front and end elevations the belt pulley on the worm shaft being behind the headstock and not seen in Fig. 3. The portion of the driving shaft inside the bed carries a worm and a bevel gear. The worm gear is above the worm. It is loose on its shaft and revolves continuously, and imparts motion to the shaft when the clutch is engaged by the hand lever on the outside of the head. Through the medium of a bevel and spur gear, motion is imparted to a pinion at the left-hand end of the clutch shaft, which also revolves continuously and is engaged with the opposite side of the clutch when the facing speed is wanted. The low speed is used when milling the thread. From the clutch shaft, the drive is conveyed by a suitable train of spur gearing to the rear end of the spindle.

Chucking Large Shells.

The method of inserting shells in the large machine is rather novel and possesses the merit of simplicity combined with accuracy and reliability. As shown in sketch Fig. 6 the extended spindle is cut away on two sides leaving a space through which the shell is lowered. When moved to the right, the base of the shell comes in contact with a hardened steel ring, the bore of which is slightly coned so as to centre the shell at this end. The opposite end of the spindle is bored out parallel to receive a flanged disc, fastened to a hollow stem which fits in a hole through the spindle. The stem is threaded on the inside, forming a nut which fits on the threaded end of a rod operated by a handwheel at the tail end of the spindle. By this means the flanged disc is drawn back into the spindle when inserting the shell, after which it is moved forward till three formed jaws on it come in contact with the shell nose and locate it centrally thus insuring a concentric and parallel thread being milled in the base end. The outer bearing is adjustable for wear, a split taper bushing being provided for this purpose.

Regular Output.

The normal products of the Co. include several types of power pumps suitable for boiler feeding, fire, hydraulic-elevator and general service. They include piston and centrifugal pumps and also duplex and triplex power pumps are suitable for a working pressure of 150 lbs. per sq. in. the former machine being illustrated in Fig. 7. Four sizes of this pump are marketed from 4 in. x 6 in. to 6 in. x 10 in., the capacities varying from 100 to 275 gals. per minute, and either direct motor drive or belt drive as shown.

A ball bearing duplex power pump for water supply systems is shown in Fig. 8, the pump having a capacity of 400 gals per hour against 80 lbs pressure. They are equally well adapted for motor or engine drive and being equipped with ball bearings require a minimum amount of attention and power.

Grinding and polishing machinery for foundry and general use forms another branch of activity, one of the latest types of buffing and polishing lathe being shown in Fig. 9. This is a double spindle lathe, each spindle being independently driven so as to allow of two workmen obtaining the maximum output without delay due to stoppage of either spindle. The drive is from the floor, allowing the frame to be completely enclosed so as to give maximum protection to belts and bearings. It is built for severe service and weighs 900 lbs.

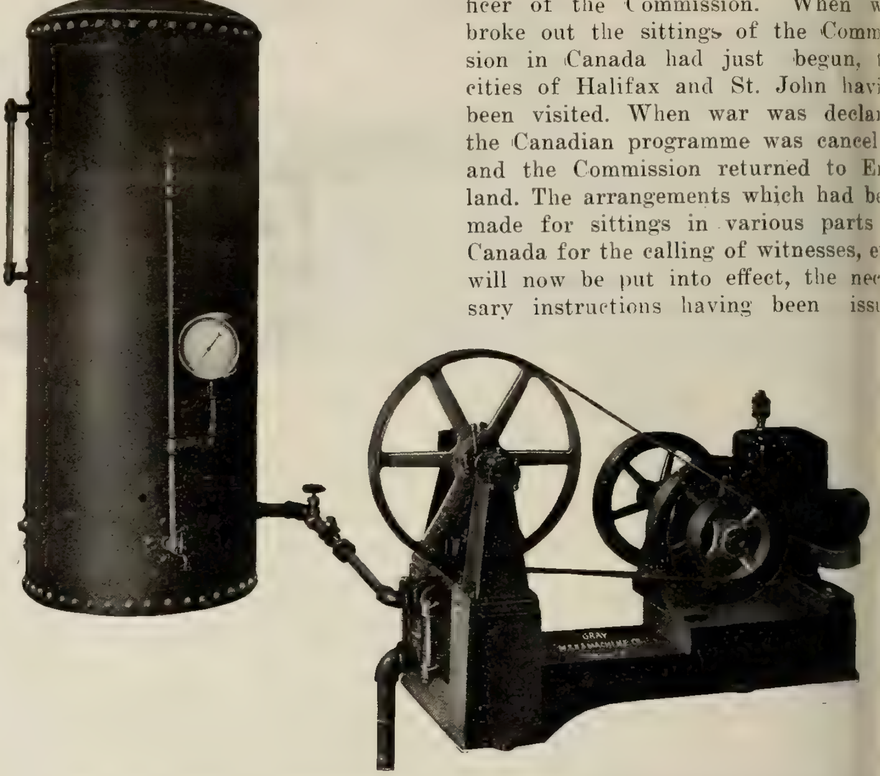

FIG. 8. BALL-BEARING DUPLEX POWER PUMP AND WATER SUPPLY SYSTEM.

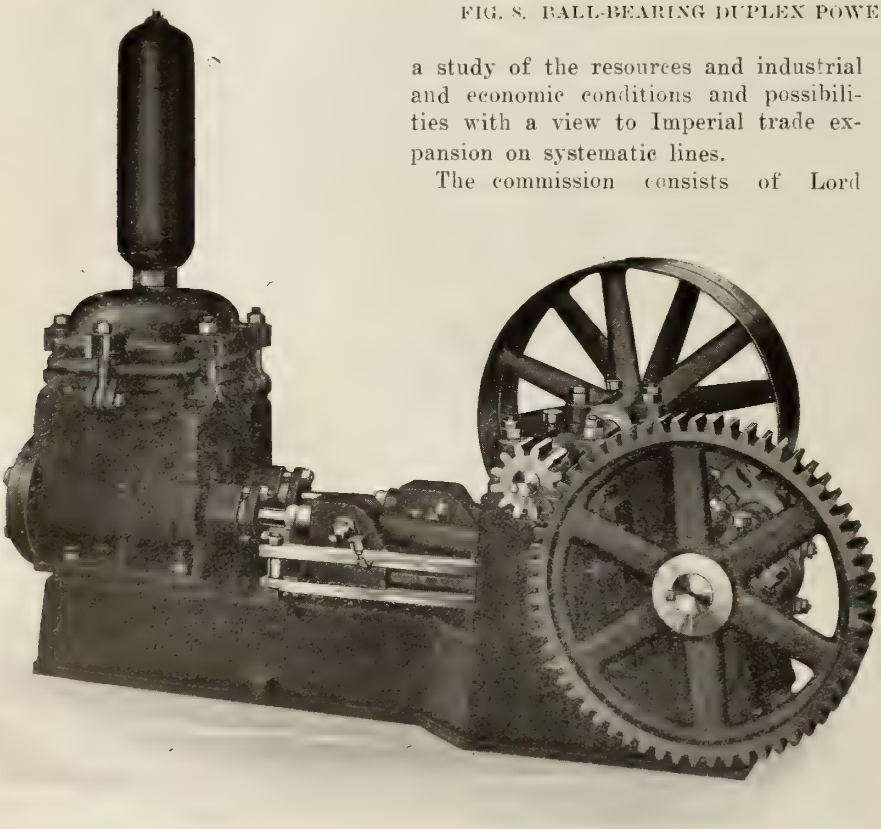

FIG. 7. DUPLEX POWER PUMP ARRANGED FOR BELT DRIVE.

DOMINIONS ROYAL COMMISSION.

THE Dominions Royal Commission will meet in Canada on September 21 next. Word to this effect has reached the Government by cable. This is the commission which, immediately prior to the outbreak of war, was completing a tour of the Overseas Dominions and making a study of the resources and industrial and economic conditions and possibilities with a view to Imperial trade expansion on systematic lines.

The commission consists of Lord D'Abernon, chairman; Sir Alfred Bateman, Sir Rider Haggard and Messrs. Lorimer, Garnet, Tatlow, of the United Kingdom; Sir George Foster, of Canada; Mr. Sinclair, of New Zealand; Sir Jan Langerman, South Africa; Sir Ed Bowring, Newfoundland.

F. C. T. O'Hara, Deputy Minister Trade and Commerce, is the local ficer of the Commission. When w broke out the sittings of the Comm sion in Canada had just begun, cities of Halifax and St. John havi been visited. When war was decla the Canadian programme was cancel and the Commission returned to E land. The arrangements which had b made for sittings in various parts Canada for the calling of witnesses, e will now be put into effect, the nec sary instructions having been issu this afternoon. The Commission will gin its sittings on the Pacific coast.

FRIENDSHIP IN BUSINESS

AN open friendship between emplo and employee—the individual friends between a manager or superintend and each of his men—is of great va to a business. It begets a loyalty t nothing else can. A man once said me, "Whenever I feel a little blue I and have a talk with Mr. Smith, manager, and I come out feeling fi We may not talk about what I had mind, but I feel encouraged just same."

I had often heard of Mr. Smit success with his business and with men, and this seemed a fair explanat of that success. Such an intercha of friendly confidence brings out best there is in the men—or shows w they lack. It enables a manager to in touch with the ruling motives of men, and to learn how each individ should be treated in order to get best results.

* * *

A WOMEN'S ENGINEERING WOR

AN experiment of a quite novel kind about to be tried in Scotland. Every has heard of the excellent work wh women have done during the last year munition works and elsewhere, but t work has been done, largely at all even in factories in which there was a great or less admixture of men workers. In the present experiment, which we understand is to be financed by two of the directors of a well-known controlled firm, all the workers are to be women, and the establishment is not destined only to be run during the continuance of the war, but to continue permanently.

The actual site of the works has not, as far as we are aware, been as yet publicly announced, but it is understood that it will be "somewhere on the West Coast of Scotland." The works themselves, which are to be run on novel and interesting lines, will be open only to well-educated women between the ages of twenty and thirty-five, who show a bent for mechanics, and in choosing the workers, preference will be given to widows and daughters of officers in the army and navy.

One feature of the working of the scheme is that the amount of remuneration given will be decided by means of examinations. The first six weeks are to be regarded as a probationary period, during which payment will be at the rate of $5 per week. At the conclusion of that time those who have shown that they have not got the necessary mechanical instinct will be told that they cannot remain at the works, and with those who have shown evidence of possessing this attribute, agreements will be made for them to work for certain periods. The examinations are to be held at the end of each six months, and on the result of these the wages are to be gauged. The actual amounts to be paid are not yet definitely settled, but it is apparently probable that the lowest will not be less than 25s. per week, and that as much as £250 a year may be reached.

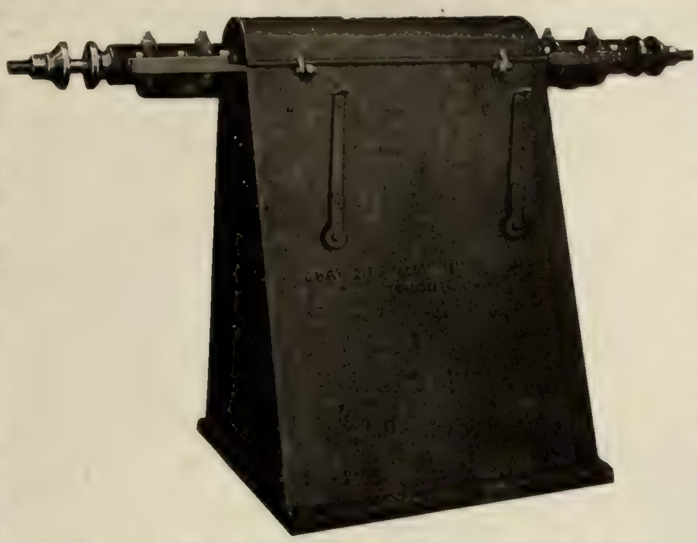

FIG. 8. DOUBLE SPINDLE POLISHING LATHE WITH FLOOR DRIVE TO SPINDLES.

Another feature of the scheme is the arrangement of the working day. There will be a night and day shift, each shift being divided into two periods of four hours each. The interval between the two halves of the day shift will be two hours long and during one quarter of it technical instruction will be given in classes which will have to be attended by those in their probationary period, though attendance will be optional for those who have passed it.

The factory will, we believe, be in operation in the early autumn, and, at first, it is intended that the work undertaken shall be the production of parts for aeroplane engines. Later on it is hoped to turn out complete aeroplane engines.

◆

MILLING FIXTURES FOR H.E. SHELLS

IN the latest designs of high explosive shells, there are three nicks cut in the fuse seat, the object of these being to provide a means of holding the fuse in position by burring over the edge of the fuse into the nicks. In consequence of this, the ¼-inch grub screw which previously served this purpose is now dispensed with. These nicks can be cut either by filing, by shaping, or by milling, but undoubtedly the greatest production will be obtained by the last method.

As the work is not heavy, it can be done on a comparatively light horizontal milling machine, the only difficulty being the provision of a suitable fixture. One of three types of fixtures will be required, for nicks may be cut in the brass fuse which is sometimes used for bottled shells; alternatively, they may be in the loose steel heads which occur in some designs; or lastly, they may be in the shell itself when this is of the bottled type and no loose bush is employed. To handle this work economically, Alfred Herbert, Coventry, England, have designed a line of fix-

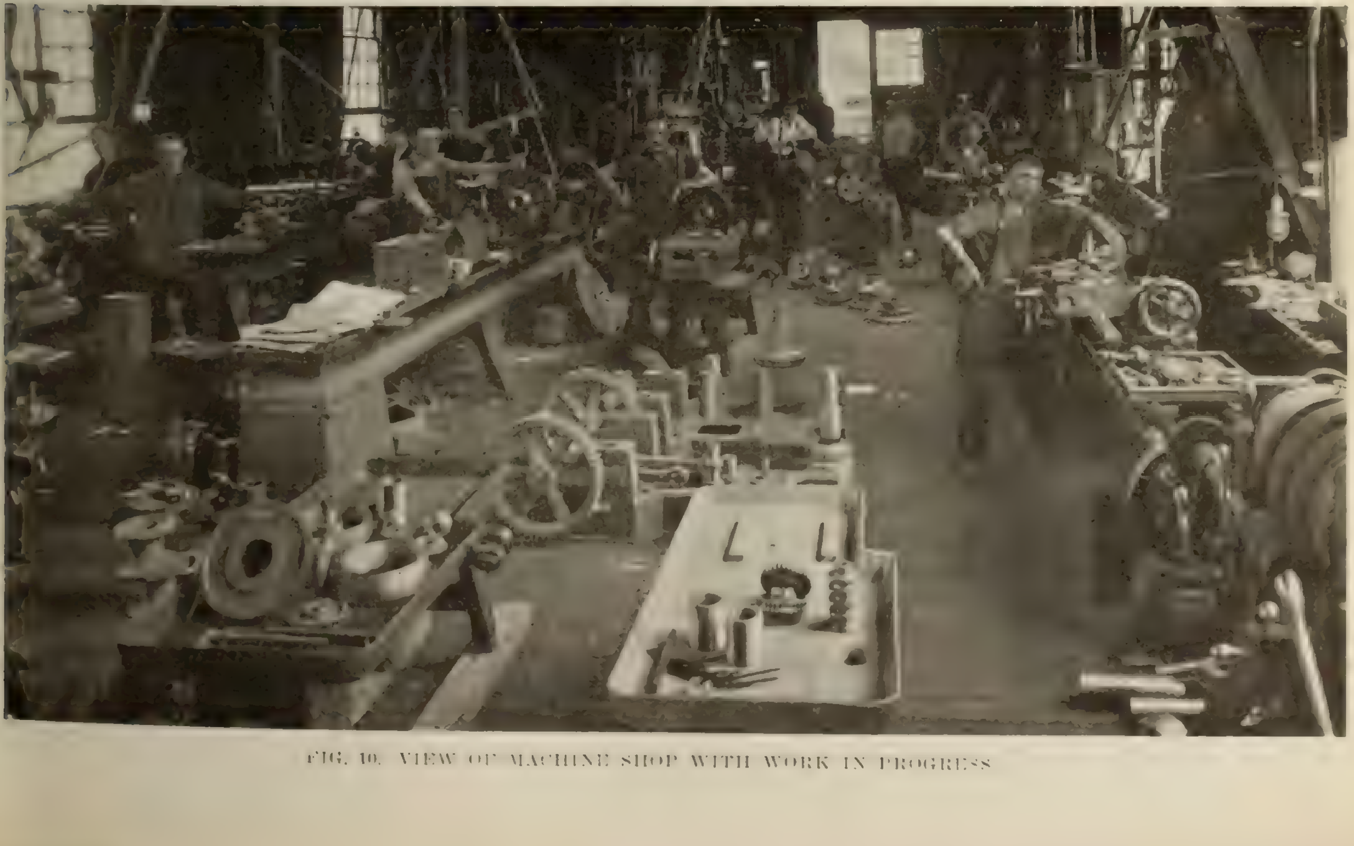

FIG. 10. VIEW OF MACHINE SHOP WITH WORK IN PROGRESS

tures for use on horizontal milling machines, these being indicated in outline by Figs. 1-2-3.

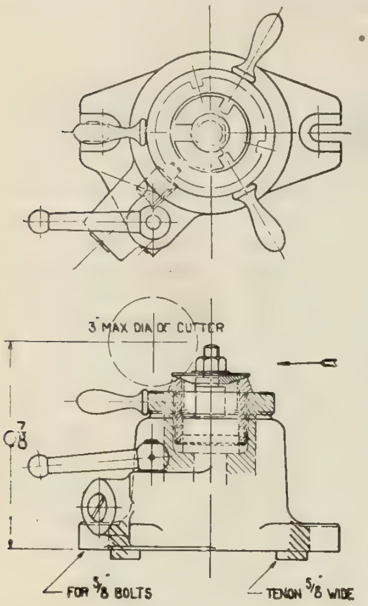

FIG. 1. TYPE "A" FIXTURE FOR 4.5 IN. SHELLS.

Type "A" Fixture.

This fixture, Fig. 1, is used for the brass bushes. It is a vertical dividing fixture provided with a curved-in index plate and plunger. The bush is located by a vertical stud, fitting into the plain bore, and is clamped by a washer and nut. The washer has three slots cut in it to clear the milling cutter ,one of these slots going right through to the centre to make the washer easily removable. The part of the stud which fits into the washer is formed to a special shape, so as to ensure the slots coming in the correct position in relation to the index plate. In cutting the nicks, the work is fed in the direction of the arrow up against the milling cutter, the fixture being indexed into three successive positions. The heights of the milling cutter is so arranged that the tangent at the point of contact with the work gives the correct inclination to the nick, and it will be seen that the nicks cut in this way have a slight radius left at the bottom. This point was taken up with the authorities when these fixtures were being designed, and they state that no objection will be taken to this slight curvature. A fixture to produce a straight bottom would have to be inclined at the correct angle, in order to traverse the nick completely, and this would entail a much more awkward fixture than is necessary by the method described.

Type "B" Fixture.

This fixture, Fig. 2, is used for the loose steel heads, and is very similar to the type A fixture, except that it is of course larger. The method of locating and clamping is the same.

Type "C" Fixture.

When the nicks have to be cut in the shell itself, a horizontal fixture must be used, as shown in Fig. 3. This fixture consists of a hollow spindle in which the shell is clamped by a set screw, the part to be nicked being pushed on to a fixed locating peg cut away on one side to clear the milling cutter. The spindle is provided with an index plate and plunger, the shell revolving on the locating plug during the indexing. This type of fixture is again designed so that the nicks have a slight curvature at the bottom, and the arrangement is very compact, for a fixture designed to cut a straight bottomed nick would be of considerable height.

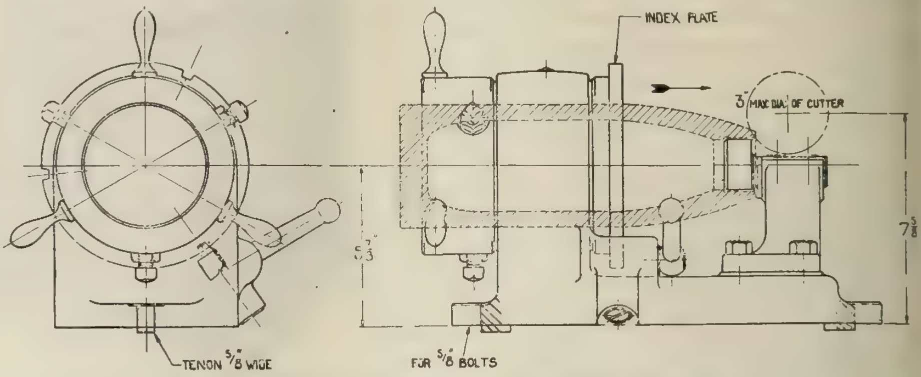

FIG. 3. TYPE "C" FIXTURE FOR 4.5-INCH SHELLS.

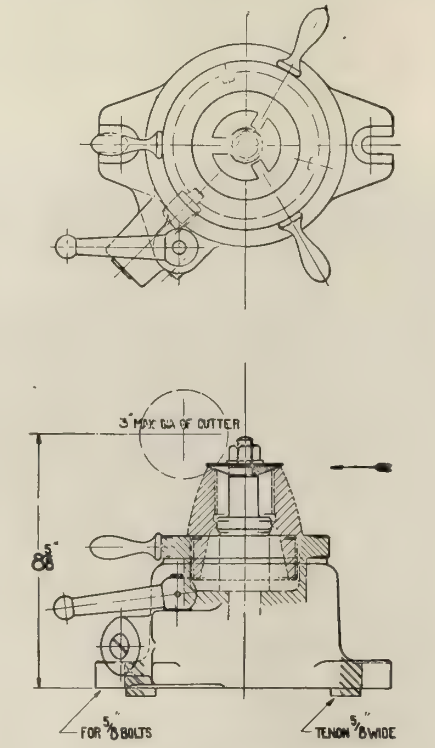

FIG. 2. TYPE "B" FIXTURE FOR 4.5 IN. SHELLS.

In all three cases the stop on the machine table should be set to limit the travel of the work, so that all nicks will be the same depth.

These fixtures are applicable to shaping machines provided they are mounted on suitable angle plates, and can also be used on lathes by mounting on the cross slide, the milling cutter being run on a mandril between centres

* * *

FEAR OF DISMISSAL

THOUSANDS of men and women are living in constant fear of losing their positions. It is good to know that, in most instances this fear is groundless, but until this fact is known to the worker he is just as unhappy as if the danger were real—perhaps more so than if he actually had been dismissed.

This fear is so blighting in its effects, so detrimental to good work, that employers and managers and all with any degree of authority in business should take every reasonable precaution to remove it from the minds of employees. When necessary to quiet the thought of a fearful employee, it is sometimes well for the superior to come right out with the assurance and say, "Don't be afraid of losing your position with us; we need you and are depending on you to help us carry on this business." Such an assurance is of untold value to a worker, not only to his peace of mind but also to his work itself.

Some employers and managers try to rule their men by purposely keeping them in fear of losing their positions. Such a policy is nothing short of cruelty. A manager who knowingly does that, has no moral right to hold authority at all. This policy should be utterly condemned wherever found. It may sometimes be done ignorantly, but the effect is the same as if done from cruel motives.

Let every sincere worker feel the satisfaction of knowing that his efforts are appreciated, and that he is not to be cast aside at the whim of any man.

The Dominion Copper Products Co. has increased its capital stock to $1,000,000.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

GATE VALVE RESEATING MACHINE

TO maintain the highest operation efficiency in any make of valve, the latter must have a perfect bearing on its seat to reduce to a minimum any possibility of leakage. Owing to the peculiar construction of gate valves, it is very difficult -without the aid of special equipment—to maintain them in good condition. To remove the seats from their fixed position requires considerable time and dexterity, often necessitating delay in the operation of the plant. However, mechanical appliances are constantly being designed and constructed which are gradually eliminating the difficulties incidental to water and steam valve operation.

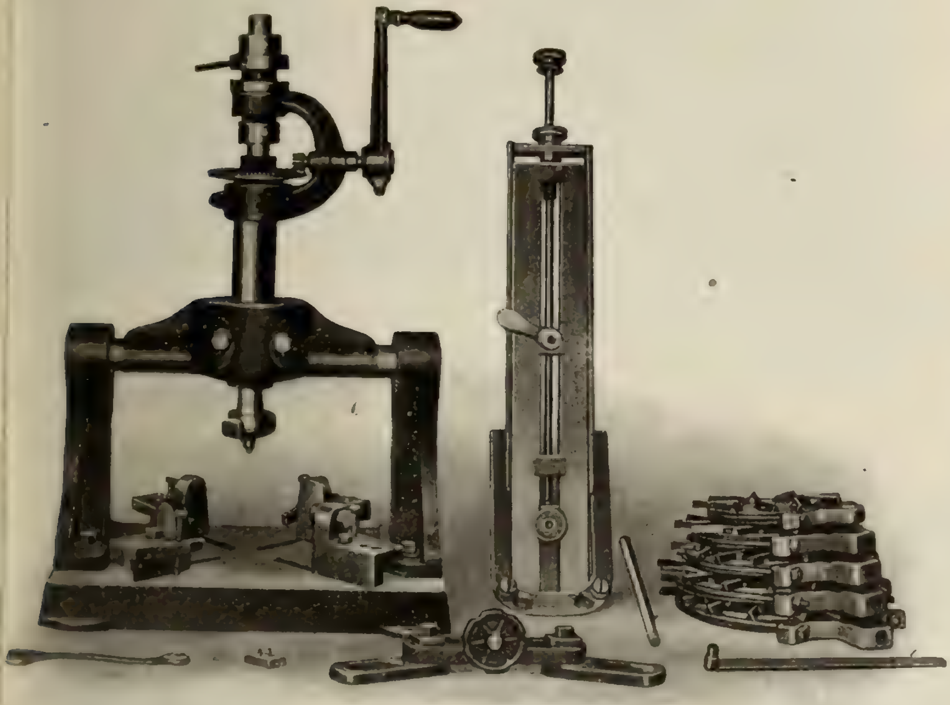

FIG. 1. COMPLETE GATE VALVE REFACING OUTFIT.

The accompanying illustrations show the Dexter Gate Valve Re-seating Machine, as recently improved, for the more efficient handling of gate valve repairs. Fig. 1 shows a complete re-facing outfit. The part to the left indicates the rigid construction of the valve disc facing device; the base plate being supplied with four adjustable jaws for holding the work, while the facing tool is carried on the end of a revolving spindle. This spindle, as well as the device in which it operates, is similar to those used in the globe valve facing attachment. The section in the centre of the cut is the portion secured to the body of the valve while the cutters are operating on the interior valve seats. Fig. 2 is a view of the machine, in position, facing off a gate valve seat, while Fig. 3 illustrates the disc cutting device in operation. The various cutters are placed at different angles in relation to their travel, thus practically eliminating the possibiilty of chatter when cutting. The circular head which carries the cutters is operated by means of a flexible cable that grips the outer surface when moved in one direction, and releases when moved back again. By this method the cutters are forced to move continually in one direction, and can be operated successfully even when the lever has only a short travel.

◆

D. C. MOTORS OF LOW HORSE POWERS

TO meet a demand for direct current motors of the smaller horse powers for direct connection to and driving all kinds of industrial machinery, machine tools and other applications requiring a low-power compact machine, the C & C Electric & Mfg. Co., of Garwood, N.J., has developed a new line of specially designed motors.

They are known as Type IB, are bipolar with interpoles, and can be furnished in ratings up to 10 h.p., either shunt or compound wound. For a general manufacturing drive, such as for machine tools and other industrial machinery, the characteristics of the shunt wound motor are the most desirable. It is essentially a constant speed machine, having close speed regulation from no load to full load, and is recommended for all purposes where the torque required for starting and accelerating does not greatly exceed full load torque. The compound wound motor is desirable for drives where the starting torque is

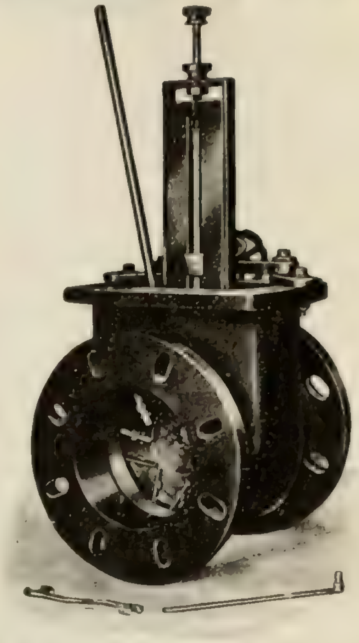

FIG. 2. FACING-OFF GATE VALVE SEAT.

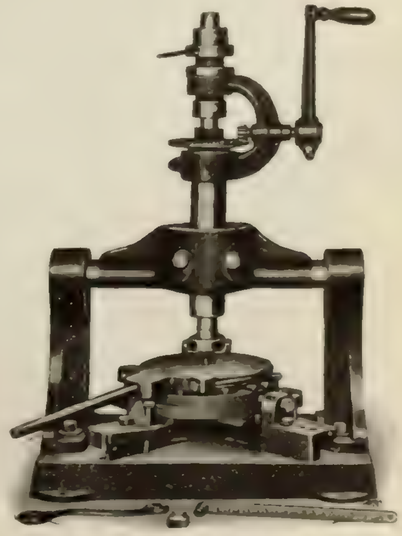

FIG. 3. DISC CUTTING DEVICE IN OPERATION.

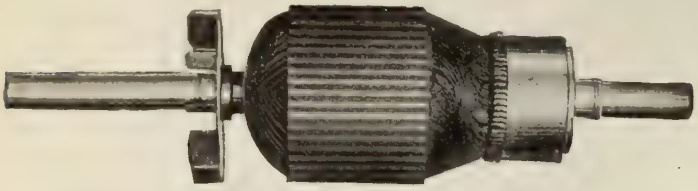
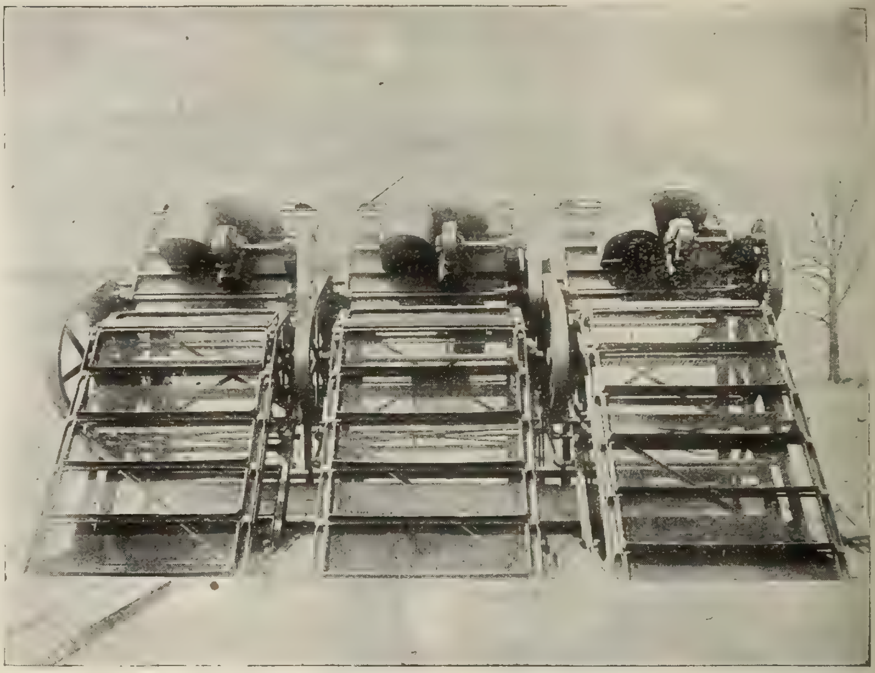
much heavier than the full load torque. This motor starts at a much heavier load than does the other, and any degree of compounding can be furnished to meet conditions.



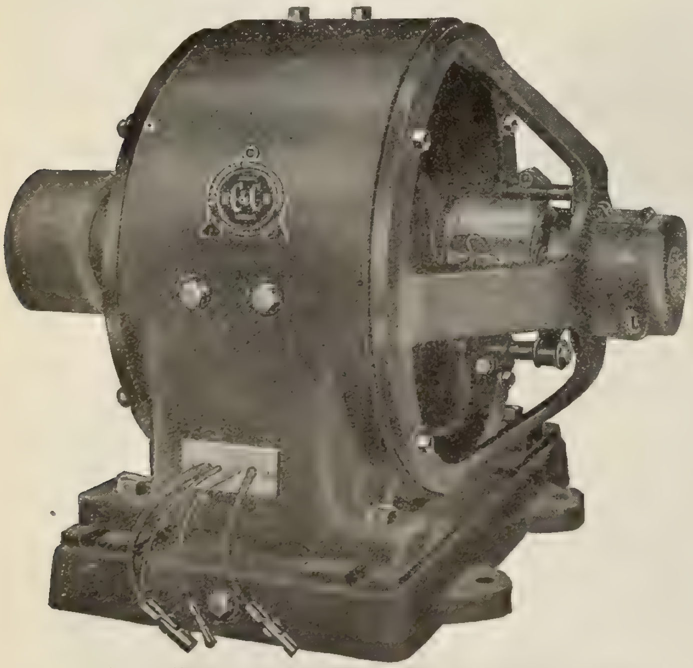
THE I. B. ARMATURE

The materials entering into the manufacture of these motors and their design are such as to make a compact machine, sturdy both electrically and mechanically. The main frame and supporting feet are cast integral, the pole pieces being separate. The main pole pieces and pole shoes are laminated. The interpole pieces are separately cast and the coils are all form wound. The pulley side bearing bracket is provided with a wide apron to protect the winding from mechanical injury, and the bearing supported by four arms with large openings between, makes a rigid open bracket, permitting free and ample ventilation. The commutator side bearing bracket has four arms, giving also a rigid bracket and free access to the commutator and brushes. Both brackets fit in a recess in the main frame, insuring thorough and rigid alignment.

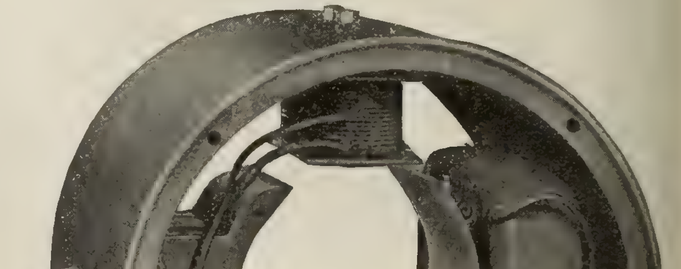
The armatures are of standard design with laminated core. An air agitating fan is placed on the pulley side of the shaft next to the armature winding to furnish the high degree of ventilation and cooling so necessary in motors of small compact frame, guaranteeing severe service and heavy overloads. The addition of interior commutating poles forms another desirable feature. In continuous operation for long periods, these motors have been found to run cool and without attention. The interpoles make possible sparkless commutation through the full range of load without changing the brush position.



SELF-CLEANING TRAVELING WATER SCREENS



C & C TYPE I. B. MOTOR WITH UNIVERSAL BASE



MAIN FRAME WITH FIELD AND COMMUTATING POLES

This new line of motors is furnished in the open type, or with perforated or totally enclosing covers for protection against dust, metal chips, dampness, etc. For belt drive the motors can be furnished with either a universal slide rail base or a belt tightener idler pulley.

SELF - CLEANING TRAVELING WATER SCREENS

THE necessity for clean circulating and boiler water in power plants has become so much of an accepted fact to-day that it is not necessary to make explanation of it in order to introduce the subject of screens for screening this water. Ever since water has been used for this purpose there have been various devices for screening it and removing at least the larger pieces of foreign matter. These devices have ranged from an ordinary grating placed in the pipe or channel to quite elaborate and finished machines.

In all of the known methods of screening the water, however, the screens themselves require attention sooner or later. This attention meant, in some cases, a great amount of labor and difficulty, and the screening of some of the devices was more or less ineffective, principally at times when cleaning was in progress.

Every engineer is familiar with the fact that no matter how many sliding screens are placed in an intake one after the other, when each screen is raised a certain amount of sediment drops down and passes under it and on to the next one. This process repeats itself until the last screen is raised and then the droppings enter the intake to the power plant and are carried into the pumps and condenser tubes where they hasten the necessity for cleaning these auxiliaries.

It was with a view to improving the conditions outlined above that a few years ago the Chain Belt Co., built three machines known as the "Chain Belt Self Cleaning Traveling Water Screens." These were installed at the south-west plant of the Commonwealth Edison Co. in Chicago.

The accompanying illustration shows the original three screens which have been in continuous operation since their installation.

The early experience of the Chain Belt Company has enabled them to make many improvements and developments in the mechanical design so that the screens built at present are quite different from the original installations. The machines consist essentially of wire screening baskets mounted on two strands of steel chain belt. These chain belts and screens form a continuous screening apron which passes over sprockets at top and bottom of the device, and are mounted on a structural steel supporting frame. There are lips on the baskets and as this screening apron moves through the water slowly and in an upward direction it carries with it particles screened from the water. After turning over the head sprockets it deposits them in a trough from which they are flushed into the river on the down stream side. The cleaning of the screen baskets is effected by having a spray pipe running back of the screen baskets which forces a continuous spray of water through the screens from the back.

In the majority of installations these screens have been placed on an incline as shown on the cut, but there are several installations which have been built in a vertical position.

PATTERNS BROUGHT FROM STORAGE.

EVEN when castings are wanted without alteration from a pattern which it is certain has never been altered, it is seldom that the latter can be taken from the stores and sent into the foundry without requiring anything done to it in the pattern-shop. A pattern in regular use can be relied on, but one which has been out of use for a long time cannot. Wood is liable to shrink and warp, especially in a new pattern which has had time for this to occur, and has not received attention since being made. Shrinkage may affect important dimensions, but more frequently it causes overlapping joints which tear up sand in being drawn from the mold. The pattern must be examined for this and tested for truth on surfaces liable to warp, besides being measured and examined for breakage or possible missing details.

A warped surface may be planed true if sufficient material can be removed without reducing too much the thickness of metal or over-all measurements. Sometimes battens are screwed on to pull the surface true, and are stopped off in the mold. In other cases a concave surface can be straightened by wetting the central part and causing it to swell, and so regain its original form. A part originally circular may become elliptical through shrinkage, and this has to be rectified, often by inserting a piece.

Shrinkage in some places can be made good by putting pieces on. Sometimes the shrinkage may be in a place where it does not matter, or it may be so small in amount that it can be ignored. Damaged corners or other parts may have to be made good by letting pieces in. Fillets are often broken or missing and require replacement. Varnish wears off when a pattern has been molded from a good many times, and more varnish must be put on, preceded by thorough glass-papering and scraping where necessary to remove roughness. Work of this kind has to be done on old patterns before they go into the foundry even when the castings required are similar to previous ones.

FILES AND THEIR NAMES

THE Cadillac Motor Car Co., of Detroit, recently came to the conclusion that many of the men in its shops were working at low efficiency, owing to lack of knowledge concerning the names of different types of files. In many cases it was thought probable that the man knew what kind of file he wanted for his work, but in ordering it from the tool supply room, wrote the wrong name on his requisition slip. Then when the file was given him, he did not wish to admit his error and so took it out to the shop and did the best work he could with it. To overcome this difficulty, a sample board has been placed outside the window of each tool supply room on which there is a complete set of files with the proper name under each file. With this system in use, the workman comes to the tool supply room, and looks at the board to determine the right name of the file that he wants before handing in a requisition slip. As a result, he is sure to get the proper file for his work.

BREAKING-IN NEW MEN

WHEN a new man begins work in an office or a department he is often left to shift for himself without an outline of his duties or an introduction to those around him. It is good to hear what a young man told me once, says a writer in The Dodge Idea.

"When I began here," he said, "the manager of this department talked things over with me for nearly an hour. He told me the names of all the officers of the firm, and what they did, the names of all the heads of the departments I would come in contact with, the names of the other people in the office, the name of the leading houses we did business with, and gave me a good, general idea of the work of the whole office, and special outline of my duties and possibilities. Then he took me around and introduced me to many of the people.

The result was that I quickly got my bearings, felt at home from the first, and soon settled down to hard work. In my previous position with another firm my experience was different. There were no introductions, and no outline, and no general information. My first three months were practically spent learning what the manager could have told me in an hour if he had taken the trouble to do it. The work here is twice as complicated as it was there, but I got the general plan of it well in mind the first day."

Every manager should, for the moment, put himself in the place of the new employee and realize what a confused sense he must have of a large and unfamiliar business, and how easily that confusion could be taken away by a good talk about the work in general.

* * *

Great Lakes Record.—Great Lakes ore carriers established a new record in the month of July, loading 9,750,157 tons, which exceeds by 242,581 tons the movement in June, which at that time was thought to have set a mark that could stand for the year. Up to August 1, ore shipments for the season aggregated 29,365,724 tons, a gain of more than 5,000,000 tons over 1913, the banner year of the trade. Detroit vessel men predict that the year's movement will approximate 59,000,000 tons.

DELIVERY OF MUNITIONS MANUFACTURING EQUIPMENT

IN munitions production we have, it is generally believed, got past the stage of belated equipment shipment, in other words, machine tool manufacturers are for the most part in a position to fill expeditiously both urgent and quantity requirements. Machine tools and attachments for the production of a varied size and type shell in Canada have been largely imported from the United States, either direct by our munitions plants or through our numerous machinery agencies. Although, as indicated, shipments are again more or less normal, comparatively speaking, deliveries are little if any improved. Both munitions plants and machinery dealers find the delivery feature equally acute to that existent over a year ago, and unhesitatingly attribute it to the incapacity of our railroads with regard to freight handling. Delays of from one to two weeks are, we understand, not unusual in railroad deliveries of munitions equipment, both local and U.S. border terminals being involved.

There are, of course, two sides to this matter, and the other or railroad version while not seeking to deny the allegations of the machinery people, pleads more or less abnormal circumstances to be sufficient justification. The railroads claim that there is a shortage of freight handlers; that those meantime employed are in large percentage unaccustomed to the work, and in consequence are slow and inefficient. They also claim that the unusual amount of general freight moving is aggravating the situation.

We are sufficiently in touch with the labor situation to know that railroad help of every kind has come under the spell of the War in one direction or another, and to be more specific has responded in large numbers to either the call to the colors or to the allurement of higher remuneration offered by munitions plants. Again, railroad revenues during the past months quite bear out the contention that unusual freight traffic is passing and must needs be cared for. Canada's munitions output, maintenance and increase is however, suffering as a result of delays by our railroads in making delivery after shipment, and just so long as individual firms affect to adjust the special disabilities under which they labor, correspondingly will an all-round improvement be delayed and munitions production continue to be curtailed.

While the railroads have made the suggestion that shipments be specially marked "For Munitions," we are of opinion that the Imperial Munitions Board, as the authoritative and governing body, should promptly call a conference of our leading machinery importers and of the railroad executives concerned to devise ways and means whereby the general irksomeness of present conditions may be minimized if not altogether eliminated. Our metal-working plants have lost none of their enthusiasm for munitions production, but find it dampened by delays in receiving equipment, especially when the latter can by a little adjustment be avoided. They were reconciled in the early days to abnormal periods between the placing of machine tool contracts and the completion and shipment of same, but now that they know that these have been eliminated, rapid transit and prompt delivery by the railroads is not unreasonably expected.

It appears to be no secret that, while Canadian manufacturers have all the shell orders they can take care of, production continues away below the expected total. Although in the returns available, the net shortage is not stated and varies considerably, in many cases both the weekly and monthly outputs are understood to be less than half what they should be. Lack of co-operation, and sections of the industry being held back through failure of ine or more supplementary sections to perform their obligations promptly are presumed to be responsible for the failure to maintain the desired output. While it has been said that many of our manufacturers have apparently trusted to luck as to their ability to fill orders which they have received, we are disposed to think that such may be reckoned as isolated instances and that what is lacking more than anything is the co-operative element.

There seems to be asserting itself the pre-war tendency to "individualism," on the part of some of our munitions plants—in other words, to keep "the other fellow" and the public as much as possible in the dark; when everything is going well, of course. While the war lasts, at any rate, let us have patriotism, and let us keep individualism buried. The delayed delivery by our railroads to our munitions plants of shell-making equipment is indicative at least of the need of co-operative effort, and no time should be lost in getting rid of the disability.

WOMEN'S WAR WORK.

THE employment of women in the manufacture of munitions in Canada has for some time now been an accomplished fact. In common with many other war developments, the probability of the ultimate adoption of such help had become a more or less familiar topic of discussion in manufacturing circles, which, combined with the wide-spread existence of such labor in Britain, had familiarized the general public with the idea.

That conditions in Britain are liberal and successful were evidenced some time ago by Sir Wm. Beardmore, who emphasized the whole-heartedness with which girls and women were working machine tools, and the stimulating effects of the knowledge their efforts were successful beyond expectation has doubtless much to do with the wonderful growth of munitions output on Britain.

In their utilization of women workers as in many other things, our enemies have betrayed a peculiar lack of common sense, not to mention consideration, and advices from a reliable authority indicate that the Central Empires are sacrificing their women on the altar of industry in a manner paralleling that of their men in battle. The number of women now employed in German engineering works is frequently as high as 80 per cent. and the question of compulsory service is being actively agitated in Germany, the claim being made that every woman should be obliged to serve her country in one way or another.

INDUSTRIAL NOTABILITIES

FRANK WILTON BAILLIE, of Baillie, Wood & Croft, Financial Brokers, Toronto; president, Canadian Cartridge Co., Hamilton; president, Bankers' Bond Co., Toronto; president, Burlington Steel Co., Hamilton; vice-president, Dominion Steel Foundry Co., Hamilton, was born at Toronto, Aug. 9, 1875, the son of John and Marian Baillie.

He commenced his business career as clerk and private secretary to the late Senator Cox, Toronto; became secretary of the Central Canada Loan Co.; and, later, was general manager of the Metropolitan Bank, Toronto. He formed the firm of Baillie, Wood & Croft, 1903; organized Bankers' Bond Co., 1912; Burlington Steel Co., 1911, and Dominion Steel Foundry Co. in 1912. At the commencement of the European War in 1914, he formed the Canadian Cartridge Co. to manufacture brass cartridge cases for the British Government at Hamilton, Ont.

FRANK WILTON BAILLIE

Mr. Baillie married Edith J. White, daughter of the late Aubrey White, Minister of Lands and Mines, Toronto; there being two sons and two daughters of the union.

His clubs are the Toronto, Albany, National, R.C.Y.C., Lambton Golf and Hamilton, and his recreations golf and motoring.

Mr Baillie has been much in the limelight recently, through his donation of a cheque for $750,000 to the Imperial Munitions Board, this sum constituting the profit on the manufacture of a certain quantity of brass cartridge cases, and which he obligated himself to so place.

In politics Mr. Baillie is independent, and in religion he is Anglican. His residence is 146 Crescent Road, Toronto, Ont.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Aug. 5.—The general state of industrial affairs has not undergone any marked change, although the continuance of extreme weather conditions, the shortage of labor and recent happenings in munitions work have rather tended to aggravate previous conditions. Little activity is reported in the scrap market.

Steel

The steel situation continues strong, and prospects of possible relief in prices were somewhat destroyed by the action of the leading makers in Pittsburgh, who advanced prices $2 a ton to 2.60c, which price has become general. Steel bands are expected to attain a similar level, while 3c is being asked for hoops. The plate market has stiffened, and inquiry from foreign and domestic sources continues good. An advance of $1 per ton is expected on structural shapes, which have remained at 2.50 for some months. Shell steel buying for 1917 has become a prominent feature of the market. Some makers report this product as being sold up to the end of the year, new sales being for next year's delivery. Billets and sheet bars are quoted at $42 to $45 Pittsburgh, wire rods being $55 and higher. Galvanized sheet prices show a slight decrease in sympathy with the spelter market, being quoted 4.25 Youngstown, while blue annealed sheets are still in fair demand.

Metals

The situation in metals, while showing little material change, is nevertheless a little more active than for some time. Copper is a little stronger owing to the absorption of second-hands. Tin is quiet and unchanged. Spelter has shown a relapse to its previous weakness, with a relative decline in prices. Lead has become quite active following a decline in Trust quotations. Antimony continues to decline.

Copper.—No new developments are noted in the copper situation. Odd lots of second-hand metal are gradually being absorbed, which is giving the general market a little better tone. No big business has been reported, and the producers are confining their activity to the filling of placed contracts. Reliable information as to what the producers are getting for metal is lacking, and current quotations are still nominal, based on the prices received for resale metal. The London market advanced considerably earlier in the week, but the present quotations are very little changed from that of last week; an advance of £1 on the week is shown in standard spot and £2 in electro, the latest quotations being £106 for standard spot, £103 for futures, and £125 for spot electro. New York market is quiet, with slight advance in the nominal quotations; prime lake at 26c show a ½c advance; electrolytic is 1c stronger at 27c, and castings at 24⅜ shows an advance of ⅛c per pound. Local dealers report a quiet market, with quotations firm and unchanged; lake, 31c; electrolytic, 31c, and 30c for castings.

Tin.—The arrival of fair-sized lots of tin, in addition to the quiet tone prevailing, has had a tendency to weaken the market. The present demand is light, and in view of the well-supplied market, metal is being offered at slight concessions on prices quoted. The London market is a little stronger, and advances are reported; standard spot shows an advance of £1 15s.; futures are £2 stronger; Straits spot has advanced £1 15s., and the Eastern price is up £2 10s.; the current quotations being £167 10s, £168 10s, £168 10s., and £171 respectively. The inactivity in the New York market has resulted in a decline of 2-10c per pound, the nominal price being 37 8-10c per pound. Local conditions are unchanged, and prices firm at 43c per pound.

Spelter.—Another reaction in the spelter situation has developed a very weak market. This is partly owing to the lack of interest shown by the brass trade. The scarcity of metal which seemed apparent a short time ago resulted in a comparatively sharp advance; but during the past few days considerable metal has become available, which has made the market very weak. Latest cables from London show a break in the market, spot having declined £12 and futures £11, leaving the quoted prices at £47 and £42 respectively. The American market has fallen off 1½c per pound, and the nominal quotation for prompt metal is 8 8-10c per pound. Local dealers have declined 1c on a quiet and weakening market, the current quotation being 14c per pound.

Lead.—Considerable activity has developed as a result of a decline in the Trust price of lead. With the drop recently made, it is expected that consumers will renew their interest in the market, as it is generally supposed that many of them are coming to the end of their reserve supply. The decline does not indicate a weakness in the general situation, but the leading interests have done this to get hold of some of the business that has been going to independents. Heavy buying by consumers may result in a return, in some measure, to former prices. The London situation is unchanged, with the exception of a slight advance in spot metal. In an effort to stimulate buying, the Trust has declined ½c on last week's price, and the outside price has declined ¼c, which puts both interests on the same basis of 6c per pound. Dealers here report a fair market and a decline of ¼c per pound; current quotations being 8¼c.

Antimony.—This metal is in very light demand and inquiries are almost nil. In many cases stocks are held by dealers that cost them over twice what they could get for it to-day. With labor conditions as they are at present, it is believed that the production of antimony at current prices must be carried on at a loss. The nominal price in New York is now 12½c, and it is thought that metal could be bought even cheaper. Dealers here report a dull market on declining prices. a drop of 3c during the week putting antimony at the low figure of 16c per pound.

Aluminum. — Conditions are unchanged and prices are firm at 68c per pound.

Toronto, Ont., Aug. 8.—The continued warm weather while being decidedly beneficial to the crops is affecting the steel trade by causing a reduction in output. Incidentally the crop prospects are very favorable and as a result an optimistic feeling prevails in business circles regarding the industrial situation. While great progress has been made in the manufacture of munitions, the daily deliveries being valued at nearly $1,000,000, production is considerably less than was hoped for or expected. Lack of co-operation is responsible for this unfortunate state of affairs, which has resulted in a shortage of some parts thus delaying the completion of the finished shells. Orders for shells placed by the British Government in Canada now total nearly $500,000,000 of which amount $200,000,000 have already been delivered. It will thus be seen that there is no lack of orders and that there is enough business in sight to keep the shell plants fully occupied for many months. After a long period of quiet the Allies are again placing large contracts for munitions with manufacturers in the United States. Three things have marked the new buying movement; the size of shells, the rapidity with which orders are being closed and the extension of delivery periods until May 1917. This indicates that enormous demand for munitions and also that further large orders are assured for Canadian manufacturers if deliveries can be maintained at the desired amount.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Steel

Conditions in the steel trade continue very active although the output of the mills has been somewhat curtailed owing to the hot weather. The domestic demand is light as is usually the case at this time of the year, but export business continues heavy with no indication of falling off. The demand for munitions being as insistent as ever, the steel companies are making a big effort to supply the necessary steel, consequently the production of rails has been affected. On this account rails are being imported from the States by Canadian railways. The C.P.R. has placed at Chicago a contract for 14,000 tons against its rail enquiry for 25,000 tons. A considerable quantity of barb wire has also been imported into Canada from mills in the States. As was expected, galvanized pipe has declined due to cheaper spelter, but black pipe is unchanged. The situation in boiler plates is getting worse and prices are very firm with a possibility of an advance at no distant date. Boiler tubes are unchanged and the market quiet. Both domestic and export demand are only fairly active on bolts and nuts and prices are unchanged. Wood screws however are in good demand and may advance.

Galvanized sheets are firmer but the situation is unchanged and the market is steady. Spelter has not declined any further and black sheets continue firm. Prices on galvanized sheets are a little firmer in the U.S. market but unchanged locally. Black sheets are in rather light demand at present, but the mills are well filled on old contracts on which they have a good accumulation of specifications, enough to run them three months or more, on an average. Blue annealed sheets are quite firm with a good tonnage demand for both nearby and far off deliveries. Prices on sheets continue to be rather irregular in the primary market but local quotations are unchanged.

In the United States the export demand for steel products is heavier and continues to sustain the market as domestic enquiry has quieted down although more activity is looked for next month. The chief feature of the market continues to be the very heavy demand for semi-finished steel in the form of billets, sheet bars and ingots while there is also a big export demand for barb wire and structural material. Steel bars are unchanged at 2.50c, plates 3.50c and shapes 2.50c Pittsburgh. Bessemer billets have advanced $1 and are now quoted at $43.00 per ton Pittsburgh. Open hearth billets and sheet bars, and forging billets are unchanged. The Carnegie Steel Co. has announced an advance of $2. a ton on steel bars. The company is reported to be filled up on bars for ten months production but the other mills can hardly be considered, on the whole, as filled up so far ahead. The above advance will probably be followed by increases in other lines and it is expected a similar increase in wire prices will be announced soon.

Pig Iron

The hot weather is having the effect of reducing the production of pig iron but otherwise the situation is unchanged. The market continues quiet and prices are unchanged.

Machine Tools

The demand for machine tools for munitions plants continues to occupy the attention of dealers to the exclusion of practically everything else. There are indications that a great many more shells will be required than was anticipated, even a short time ago, and considerable activity in the machine tool market is thus assured for some time to come. The shells now required are mostly of the high explosive type and of large calibre. The tools principally required are heavy duty lathes having a swing from 24 in. to 30 in. Deliveries on such equipment are fairly good now, but prices have an upward tendency. With regard to deliveries local dealers are complaining about shipments being held up in the freight yards, the delays ranging from one to two weeks. It is believed that some arrangement will be made to relieve the situation as it is of the greatest importance that machine tools, destined for munitions plants, should be delivered as soon as possible.

Supplies

The demand for machine shop supplies continues brisk and prices continue very firm. The market is very steady and there are very few price changes to note. A sharp advance has been made in linseed oil which is now quoted at 90c for raw and 93c for boiled oil. Turpentine has declined 1c and is quoted at 69c one gallon. A break in the price of Pennsylvania crude oil has unsettled the market as it will probably affect the refined situation. No change however has been made in gasoline in the meantime although later on in the year prices may be easier.

Metals

The general situation in the metal market is unchanged and prices have been maintained at last week's levels with the exception of lead which has declined. A good demand for metals for munitions continues but ordinary business is quieter on account of the usual summer dullness. Copper quotations are still nominal but conditions in the market are improving because of the gradual absorption of metal in second hands. The tin market is dull and easy, at unchanged quotations. Spelter is dull with comparatively little interest being shown by consumers. The Trust has reduced its price on lead to the same level as the independents. Antimony continues weak and quotations nominal, while Aluminum is also unchanged.

Copper.—The buying movement which has been so long expected in the copper market has not developed yet but prices are unchanged and nominal. Comparatively little copper has been available recently as many refiners sold nearly all their production some time ago. If consumers can hold out until the end of September without heavy buying, prices may decline, but if they are obliged to buy heavily soon, an advance in prices is expected. Quotations are unchanged at 29c per pound.

Tin.—The market is quiet and dull at unchanged quotations. The demand for tin is light as consumers are not taking much interest in the market for either spot or futures. Tin is quoted locally at 44c per pound.

Spelter.—The demand for spelter continues light particularly from the brass mills although galvanizers are buying more metal. The market is steadier but quiet and unchanged at 13½c per pound.

Lead.—The Trust have reduced their price ½c per pound to the basis of 6.00c New York, bringing the price to the same level as the outside market. The independents however are cutting prices which indicates continued weakness in the market. Buyers who have been holding back in anticipation of this reduction are expected to come into the market now, but the buying movement has not started yet. Lead had declined locally and is now being quoted at 8¼c per pound.

Antimony. — The market continues weak with prices nominal and unchanged at 19c per pound.

Aluminum.—There is nothing of particular interest to note in the market and quotations are unchanged at 68c per pound.

WORLD-WIDE BLACKLIST

SYREN AND SHIPPING, in the course of an article protesting against American criticism of the British blacklist on certain commercial houses, says the total number of blacklisted firms in all countries exceeds 1,500 as follows; Spain, 167; Brazil, 140; Netherlands, 120; Argentina and Uruguay, 95; Morocco, 88; Portuguese East and West Africa; Guinea and Rio Muni, 87; Japan, 86; United States, 85; Norway, 83; Portugal, 79; Sweden, 72; Netherlands and East Indies, 70; Ecuador, 69; Persia, 56; Greece, 50; Philippines, 44; Peru, 41; Chile, 35; Bolivia, 22; Cuba, 10; Central America, 5 Paraguay, 3; Columbia, 1.

Syren and Shipping asks: What has America to protest about? Japan does not talk of remonstrances and protests, and she is our Ally. Neither, so far, has Brazil nor other countries concerned, except Argentina."

CANADIAN RAILROAD EARNINGS

GROSS earnings of the three big railroad systems of Canada in July were the largest for any month of the current year to date and, with the exception of last October, the largest for any month since the recovery from the 1914 slump. The aggregate of $20,956, 091 was approximately a million dollars higher than the May total, and $1,110,000 higher than the June total. As compared with the same month a year ago there was a gain of $7,040.445, or 50.6 per cent. For the seven months of the current calendar year the gross earnings of the three systems aggregate $125,559,779, a gain of no less than $36,819,066, or 41.5 per cent.

A fair indication that the volume of traffic handled by the roads in July was quite exceptional for a midsummer month is afforded in a comparison with the returns for last October, when every available car was being pressed into service to handle the record-breaking crop in the West. In October, 1915, the total gross was $21,656,191, or only $700,100 greater than the July, 1916, total.

The C. P. R. gross figures for the month give a total slightly less than that of July for either 1912 or 1913, but apart from those months it was the best July in the company's history in point of volume of business, and will probably be the best in point of net profits. The C. N. R., with new branch lines linked up, makes a spectacular showing with a 95.5 per cent. gain for the month, while the Grand Trunk improved on its average monthly gain since the beginning of the year.

Gross earnings for the month compiled from the completed weekly returns with those for the last ten days of July, and the increases over a year ago follow:

Road.	July gross.	Inc.	P.C.
C. P. R. ..	$11,795,000	$4,348,000	58.4
G. T. R...	5,326,891	819,945	18.2
C. N. R...	3,834,200	1,872,500	95.5
Totals..	$20,956,091	$7,040,445	50.6

The returns for the last ten days of July follow:

Road.	Earnings.	Inc.	P.C.
C. P. R. ..	$3,800,000	$1,324.000	53.5
G. T. R. ..	1,810,713	273,572	17.8
C. N. R. ..	1,207,300	572,400	90.1
Totals ..	$6,818,013	$2,169.972	46.6

Aggregate gross earnings of the three system by months so far this year, and the increases over 1915, follow::

Month.	Earnings	Inc.	P.C.
Jan.	$14,724,216	$3,966,003	36.9
Feb.	14.667,915	3,237,879	28.3
March ..	17,344,243	3,731,539	27.4
April ...	18,077.805	4.959,127	37.8
May	19,959,336	7.224.934	56.7
June	19,840,173	6 659,139	50.5
July	20,956.091	7,040,445	50.6

* * *

Selection of Coal.—The proper selection of coal for each plant is essential to secure the maximum economy. Some plants will find screenings to be the most economical, while a plant in the same block may fine run-of-mine to be the best. Still another plant might find nut, pea and screenings the best. Local conditions must be considered, and tests are the only way in which the best kind of coal can be determined. What your neighbor finds to be the best may be the worst for your plant. Price per ton has very little to do with this matter; it is purely a case of the cost of fuel per pound of steam.

U.S. FIRMS AND INDIVIDUAL BLACKLIST

THE Official Gazette of the British Government has published the following names of American individuals and firms placed on the blacklist under the Trading with the Enemy Act:

Philip Bauer Co., 68 Broad street, New York.

Beer, Sondheimer & Co., New York.

Simon R. Blumenthal, of Zimmerman &. Forshay, New York.

Herman Botzow, of O. C. Kanzow & Co., New York.

Brasch & Rothenstein, 32 Broadway, New York.

Maurice Bunge, of MacLaren & Gentles, New York.

Alf. Burun, of Brasch & Rothenstein, New York.

Goldschmidt Chemical Company, 60 Wall street, New York.

Goldschmidt Detinning Company, 60 Wall street, New York.

Goldschmidt Thermit Company, 90 West street, New York.

Gravenhorst & Co., 96 Wall street, New York.

Carl Grubnau & Son, 144 Arch street, Philadelphia, 74 Wall street, New York and Boston.

Oscar L. Gutelman, of Knauth, Nachod & Kuhne, New York.

Charles Hardy, 50 Church street, New York.

Hasenclever & Co., 24 State street, New York.

Bernhardt, Hasenclever & Soehne, 21 State street, New York.

Maryan H. Hauser, of Zimmerman & Forshay, New York.

Alfredo Hirsch, of MacLaren & Gentles, New York.

Franz H. Hirschland, of Goldschmidt Thermit Co., New York.

Robert W. Howe, of Brasch & Rothenstein.

William E. Hamburg, 25 Beaver street, New York.

International Hide & Skin Company, 59 Frankfort street, New York.

International Import and Export Company, 136 South Fourth street, Philadelphia.

J. Isaacs, of John Simon & Bros.

Max Jaffe, 15 William street, New York.

J. A. Kahl, 82 Beaver street, New York.

Kanzon & Co., 11 Broadway, New York .

Otto C. Kanzon, of Kanzon & Co., New York.

H. Kempner, Cotton Exchange, Galveston, Texas.

Knauth, Nachod & Kuhne, 15 William street, New York.

Mary I. Knauth, of Knauth, Nachod & Kuhne, New York.

Wilhelm Knauth, of Knauth, Nachod of Kuhne, New York.

Hermann C. Kupper, 52 Murray street and 536 111th street, New York.

MacLaren & Gentles, 222 Produce Exchange, San Francisco.

George W. McNear, 433 California st., San Francisco.

A. Magenheimer, 68 Broad street, New York.

Marx Maier, 200 Fifth avenue, New York.

Merchants Colonial Corporation, 45 William street, New York.

Carl Muller, of Muller, Schall & Co.

Ernest Muller, of Schuchardt & Schutte .

Muller, Schall & Co., 45 William street, New York.

Frederick Muller-Schall, of Muller, Schall & Co., New York.

Maris Nachod, 15 William street, New York.

National Zinc Corporation, New York.

Richard Neuhaus, of the Electro Bleaching Gas Company, New York.

K. & E. Neumond, 25 Broad street, New York .

Rolin C. Newton, 15 William street, New York.

Norfolk Refining & Smelting Company, of Virginia.

Orenstein & Kopper, of Pennsylvania.

Edmund Pavenstedt, of Muller, Schall & Co., New York .

Leopold Pelatz, 17 Battery Place, New York.

Petroleum Products Company of California, San Francisco.

Louis J. Rees, of Zimmerman & Forshay, New York.

Reuter, Broeckelman & Co., 59 Pearl street, New York .

Alfred Richter, of Reuter, Broeckelman & Co., New York.

Roessler and Hasslacher Chemical Company, 100 William street, New York.

Rubber and Guayule Agency, 108 Water street, New York.

Townsend Rushmore, 82 Beaver street, New York.

William Schall, Jr., of Muller, Schall & Co., New York.

Schenker & Co., 17 Battery Place, New York.

G. F. Schloetelborg, 318 Globe Building, Seattle.

Paul Schmidt, of Rubber and Guayule Agency, New York.

Schenker & Co., 17 Battery Place, New York.

Schuttle, Bunemann & Co., 15 William street, New York.

John S. Scully, of Zimmerman & Forshay, New York.

Siemssen Company, 82 Beaver street, New York.

John Simon & Bros., 15 William street, New York.

L. Sonneborn Sons, 262 Pearl street, New York.

Southern Products Trading Company, 15 William street, New York.

Edward Stegemann, Jr., of Brasch & Rothenstein, New York.

Superior Export Company, 90 West street, New York.

Texas Export and Import Company, Galveston.

Ernest Ulrich, 15 William street, New York.

Edward Weber, of Rubber and Guayule Agency, New York.

Otto Wehrenberg, of Philip Bauer & Co., New York.

Arend H. Weingardt, 15 William street, New York.

Zimmerman & Forshay, 9 Wall street, New York.

Carlowitz & Co., 82 Beaver street, New York.

Charles Cullen, Ocala, Florida.

Armin Czech, of International Import and Export Company.

Eugene Dittzgen Co., 166 West Monroe street, Chicago, and 218 East 23rd street, New York.

Electro Bleaching Gas Company, Buffalo avenue, and Union street, Niagara Falls, and 25 Madison Square avenue, New York.

E. H. Erlanger, 60 Wall street.

Carlos Falk, of MacLaren & Gentles.

GUN ABOARD DOES NOT AFFECT STATUS.

THE fact that a merchant ship is armed with a gun with which to defend itself does not change its character so as to permit men engaged as crew to refuse to go on board and serve, even though the contract they have signed are the ordinary pre-war Articles relating to merchant ships.

This was the effect of a judgment handed down recently by Judge Leet in the case of five firemen who refused to board a ship sailing from Montreal to England. The men were sentenced to ten days each in jail, His Honor remarking that he wished to be lenient under the circumstances, and that he believed that the men had probably acted in good faith. The men were engaged in New York through agents of the steamship company, it having been found impossible to get the necessary complement here. This is the first case of this kind which has been tried in Canada, and the judgment establishes, therefore an important precedent.

Judge's Summing Up.

His Honor remarked at the outset that the charge of desertion against the men could not stand, for it had been shown that they were under surveillance from the time of their arrival here. The other charge was of refusing to go on board the ship. The judge reviewed the facts of the case, the hiring of the men in the United States, their arrival here, the non-arrival of their baggage, and its subsequent appearance as a result of efforts on the part of the shipping company.

"The only question was to decide whether the fact that the ship was armed makes any difference," he continued. "I have no experience in marine matters, and do not know much about the law regarding the arming of a merchant ship for defensive purposes. It is a question whether the carrying of this gun would change the nature of the boat, or make such a difference in the condition of affairs as would allow the men to refuse to carry out their contract. Certain facts connected with the case are matters of common knowledge. These men knew, must have known, that there was war between Great Britain and Germany, and that every vessel leaving a Canadian port was in danger, that it might be overhauled by a German cruiser or submarine, captured or sunk. That is a fact that is so public that everybody must know of it. If they were willing to come and take service on a merchant ship, then the fact that it was sailing from a Canadian port would make no difference.

"From the evidence given, and the authorities cited," continued His Honor, "I do not think that it does make any difference that the ship carried this gun." He remarked on the means of protection which would be afforded the ship across to England.

"I, therefore, come to the conclusion that because it carried one gun for the purpose of defence is not a reason for declining to go on board. They knew, when engaged in New York, that Canada was a British country, and that the ship was going to England and return. All the risks of the trip were appreciated, and I cannot see that the fact that the ship carried a gun made any difference in the agreement, or added to the risk, or allows a pretension to claim that the engagement was made under false pretences. I have, therefore, to find that you are guilty."

In regard to the penalty, the court pointed out that the ship had sailed short five of its crew because of the action of the accused, and the result would perhaps be serious to the ship, and in any case mean more work for those on board. However he felt that the men had acted in good faith, and their side of the case had been put by their spokesman in a sincere manner, and under the circumstances he would not be severe. Sentence of 10 days followed.

◆

SAFETY WORK POSSIBILITIES

SAFETY work enables not only the employee to get a clearer and better understanding of what the management is trying to do, thereby creating a kindlier feeling on the part of the employee toward the employer, but it also enables the employer to get a closer insight, perhaps a more sympathetic understanding of the worker's attitude. After all, the distance between the top of the heap and the bottom, does not change human nature very much. Both top and bottom are usually cast in pretty much the same mold. Boss and bossed—God made them both.

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Thorold, Ont.—The Ontario Power Co. will build an addition to its machine room here.

Shipsaw, Que.—Price Bros. & Co., will install a 5,000 h. p. turbine and generator at their plant here .

Sherbrooke, Que.—H. G. James proposes making an addition to his machine shop to cost $7,000.

St. Catherines, Ont.—The McKinnon Dash & Hardware Co., will build an extension to their power plant.

Thorold, Ont. — The Toronto-Niagara Power Co., is building a transformer house at a cost of $100,000.

Nelson, B.C. — The West Kootenay Power & Light Co., is installing an 8,000 h.p. unit in their No. 2 plant.

Osaquan, Ont.—The Indian Lake Lumber Co., will develop a water power here. F. F. Wilson is superintendent.

Bothwell, Ont. — Crotty & Elliott, are having plans prepared for an oil power plant to be erected at a cost of $5,000.

Pembroke, Ont.—The Pembroke Electric Light Co., will build a brick and reinforced concrete sub-station at a cost of $303,000.

Porcupine, Ont.—The Northern Power Co., will install a 4000-h.p. water turbine and generator in its power plant at Wawaitin, Ont.

Orillia, Ont.—The E. Long Co. has taken over the Tudhope-Anderson Co's. wheel works building and will equip it for a machine shop.

Walkerville, Ont.—The Motor products Corporation in which W. C. Rand of the Rand Mfg. Co. of Detroit is interested, will build a plant here.

Thorold, Ont. — The Ontario Paper Co., will erect a sulphite mill adjoining their plant here. W. T. Trimble care of the company has charge of the work.

Fredericton, N. B.—The C. P. R. will erect four concrete buildings at Mc-Adam Junction to be used as a power house, coaling plant, storage building, and blacksmith shop.

Ottawa, Ont.—J. Sutherland of this city has received the contract for the erection of a power plant on Slater Street for the Imperial Realty Co., Ottawa, to cost $30,000.

Montreal, Que.—William Hood & Son, are in the market for a 10 or 15-h.p. electric motor, a heavy Bliss trimming on punching press, a power hacksaw, and a 1000 to 2000-lb. drop forging hammer.

Renfrew, Ont. — M. J. O'Brien will proceed with his development scheme at Calabogie, where 5,000 h.p. can be had. A power plant will be erected there and a transmission line installed between that point and Renfrew.

Port Colborne, Ont.—The International Nickel Co. has secured an option on a site here for a nickel refinery. No definite decision has been arrived at regarding the location of the plant, but it is probable that this town will be selected.

Sudbury, Ont.—The British-American Nickel Co. will commence operations at once on the construction of its refinery near here. The concern is controlled by Canadians, but financed in the Old Country. It will sell its product for the present entirely to the British Government. It is supposed to be controlled by the Mackenzie & Mann interests.

The Nova Scotia Steel & Coal Co., New Glasgow, N.S., contemplates making considerable extensions at its iron mines, Wabana, Newfoundland. These extensions include new hoisting equipment, boilers, pumps, compressed air plant, power lines, cables, ventilating plant, industrial railroad track, hauling cable, etc. R. E. Chambers, is manager of ore mines and quarries.

Dartmouth, N.S.—Involving an expenditure of $2,000,000, work is now going forward on the Imperial Oil Co.'s new refinery on the Dartmouth shore of Halifax harbor. Over 400 acres of land have been purchased, and the plant, as originally planned, will cover 40 or 50 acres, the remainder of land being for expansion purposes. There will be storage tanks, machine shops, warehouses, and all the other equipment that goes with a modern oil refining plant. S. S. Shatford is manager.

General Industrial

The Noble Mfg. Co., St. Thomas, Ont., has been purchased by Peter Klob, of Toronto, for $45,000.

Penetang, Ont.—Fire destroyed the Furnace Co's. brick plant and machine shop. The loss which is heavy is partly covered by insurance.

Doon, Ont.—The plant of the Doon Fibre Co., owned by James Huber recently totally destroyed by fire, will be rebuilt and new equipment installed.

Brantford, Ont.—The Brantford Carriage Co. has purchased the business and plant of the Baynes Carriage Co., Hamilton, Ont. The latter concern will be closed up.

Toronto, Ont.—A well known chewing gum manufacturing firm, contemplate erecting a big factory in the east end at a cost of $165,000. A building permit has been applied for.

Chatham, Ont.—Work has now been commenced on the $45,000 addition to the American Pad & Textile Co., plant on Queen and Richmond street. Wells & Gray, Toronto, are the contractors.

Winnipeg, Man.—The Dyson Co., manufacturers of pickles, etc., are looking for a new site on which to erect a factory. This is necessary on account of the heavy demand during the past year.

Winnipeg, Man.—The mill and boiler-house of the Winnipeg Paint & Glass Co. factory, corner of Gertrude and Scott streets, Fort Rouge, are a total loss as the result of a fire which broke out on August 2. The loss is estimated at $100,000, fully covered by insurance.

Toronto, Ont.—A. S. White, of White & Co., brokers, New York, and president of the Federal Dyestuff & Chemical Corporation, spent a day recently in the city with R. R. Bongard, in consultation regarding the plans for establishing a branch of the Federal Company in Canada. The parent corporation operates at Kingsport, Tennessee.

Collingwood, Ont.—The buildings and plant of the Collingwood Packing Co. was totally destroyed by fire on Sunday night. The plant has not been in operation since the company became insolvent about three years ago. The building and plant was valued at about $150,000. Amount of insurance is not known.

Municipal

Hamilton, Ont.—A steam-driven turbine pump will probably be installed at the Beach pumping station at a cost of $100,000.

Petrolia, Ont.—A by-law to grant concessions and a site of 25 acres to the Lambton Flax Co., was carried on July 31 by a large majority.

Hamilton, Ont—The City Council, is having plans prepared for an addition to the waterworks pumping plant to cost $70,000. James Bain is the engineer.

Port Moody, B. C City Engineer Kilmer has arranged for the purchase of 11,000 feet of fire hose for fire protection in view of the recent installation of water service .

Renfrew, Ont. — The Town Council have decided to proceed with the development of power at the first chute of the Bonnechere River, where 1,500 h.p. is available. The cost of the development is estimated at $140,000.

Tenders

Drummondville, Que.—Tenders will be received August 15 for the construction of mechanical gravity filters, with a capacity of 500,000 U.S. gallons per day, also supplementary tenders for plant without machinery. W. A. Moisan, town clerk.

Toronto, Ont.—Tenders will be received by the Chairman, Board of Control, up to August 15, for the supply and delivery of one 5-ton travelling beam. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Carberry, Man.—Tenders will be received up to August 25, for the purchase of the following oil tanks and outfits: Two complete steel oil tanks, capacity 12,000 American gallons each with two pumps, piping, fittings and all connections. Apply W. D. Card.

New Toronto, Ont.—Tenders will be received by the Village Council until August 14, for the construction of sanitary sewers and a sewage pumping station. Forms of Tender may be obtained and plans and specifications seen at the office of the Engineer, T. Lowes, Mimico, Ont.

The Pas, Man.—Tenders will be received up to August 16 for all trades in connection with the erection of a public building at The Pas. Plans and specifications may be seen at the office of the architect, G. Nelson Taylor, The Pas, Man., or at the Winnipeg Builders Exchange, Winnipeg.

Winnipeg, Man.—Tenders, addressed to the Chairman, Board of Control, will be received up to August 14 for the supply and delivery of 4,500 Imperial gallons of transformer oil to the City Light and Power Terminal Station. Instructions to bidders, specification and form of tender may be obtained at the office of the City Light and Power Department, 54 King Street.

Winnipeg, Man—Tenders will be received until August 21 for the various works required in the completion of the New Parliament Buildings, and not included in the general contract. The works include structural steel, heating and ventilation, electrical conduit and wiring. Particulars may be obtained from S. C. Oxton, Deputy Minister of Public Works, Winnipeg.

Ottawa, Ont.—Tenders will be received until Friday, August 18, 1916, for the supply of filing cabinets for Dominion public buildings generally. Plans, specifications and forms of contract can be seen and forms of tender obtained on application to the office of Edwin Francis, caretaker, Post Office, London, Ont.; R. L. Deschamps, overseer of Dominion Buildings, Post Office, Montreal; Thos. A. Hastings, clerk of works, Postal Station "F," Toronto, and at the Department of Public Works, Ottawa.

Ottawa, Ont—Sealed tenders, addressed to the undersigned and endorsed "Tender for Burleigh," will be received up to noon on 14th August, for the purchase, as she lies, of the schooner Burleigh, length 101 feet, breadth 25 ft. 6 in., depth 10 ft. 8 in., gross tonnage 148.81, registered tons 129.88, built in Shelburne, N.S., in 1904. The Burleigh is a three-masted schooner and is equipped with a 40 h.p. auxiliary gasoline engine, built by the Sterling Engine Co. Permission to examine the vessel may be obtained on application to the Captain Superintendent, H.M.C. Dockyard, Halifax, N.S., from whom further particulars may be obtained. G. J. Desbarats, Deputy Minister of the Nvaal Service. Department of the Noval Service, Ottawa, July 22, 1916.

Assiniboia, Sask.—Tenders will be received up to August 15 for the supply and delivery of the following machinery and materials:—(A)—For the supply, delivery and erection of an 150 h.p. internal combustion engine; (B)—For the supply and delivery and erection of generator, exciter, switch board, and other

Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department is able to present the following list of the moreimportant British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

BRAZIL
Bahia, British Consul.
Rio de Janeiro, British Consul General.

CHILE
Valparaiso, British Consul General.

COLOMBIA
Bagota, British Consul General.

ECUADOR
Quito, British Consul General.

EGYPT
Alexandria, British Consul General.

FRANCE
Havre, British Consul General.
Marseilles, British Consul General.

INDIA
Calcutta, Director General of Commercial Intelligence.

ITALY
Genoa, British Consul General.
Milan, British Consul.

MEXICO
Mexico, British Consul General.

NETHERLANDS
Amsterdam, British Consul.

PANAMA
Colon, British Consul.
Panama, British Vice-Consul.

PERU
Lima, British Vice-Consul.

PORTUGAL
Lisbon, British Consul.

RUSSIA
Moscow, British Consul General.
Petrograd, British Consul.
Vladivostock, British Consul.
Odessa, British Consul General.

SPAIN
Barcelona, British Consul General.
Madrid, British Consul.

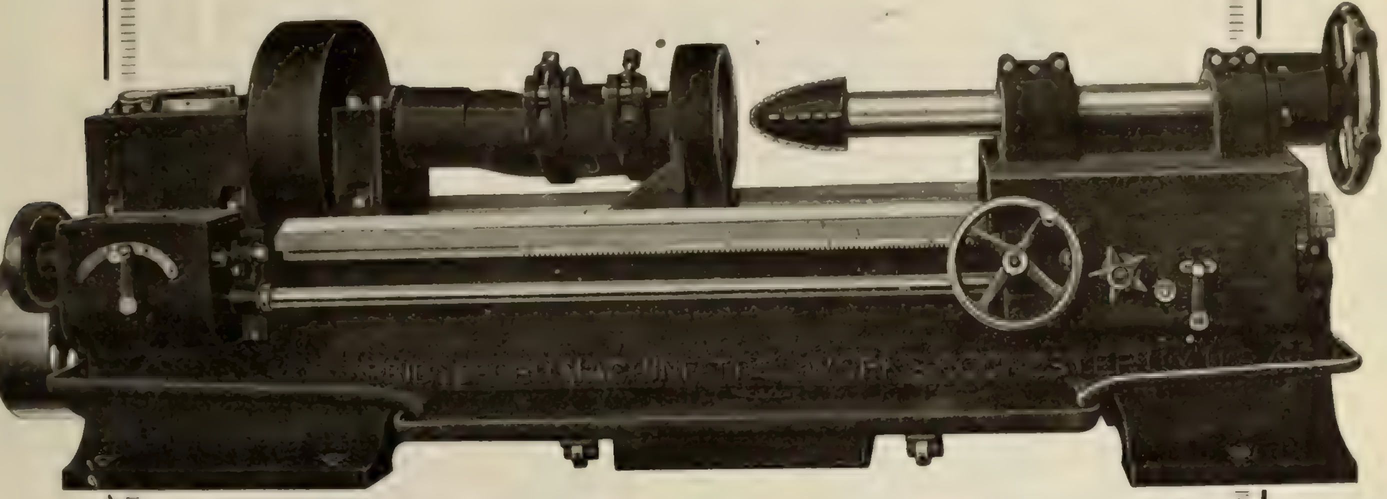
SWEDEN
Stockholm, British Consul.

SWITZERLAND
Geneva, British Consul.

URUGUAY
Monte Video, British Vice-Consul.

VENEZUELA
Caracas, British Vice-Consul.

BRIDGEFORD 9.2" BORING LATHE



Massive strength. Superior workmanship. These features are so prominent that a mere glance at the illustration will reveal them to you. It is a machine of the heavy duty, low swing type, having a specially designed carriage with auxilliary for internal profile. Carries a 6" steel bar with male taper, allowing for light design of cutter heads; 3 automobile style speed changes, all hardened and running in oil bath. A chip tray is attached and used in conjunction with stationary lubricant tank. Regular equipment comprises everything except chuck, steady rest and cutter.

apparatus; (C)—For the supply, delivery and erection of pumps, motors, piping and air compressor; (D)—For the supply and delivery of two pneumatic storage tanks; (E)—For the supply and delivery of one oil storage tank; (F)—For the supply and delivery of poles, wire and line material; (G)—For the supply and delivery of approximately 17,500 feet of 4 in., 6 in. and 8 in. steel pipe, or cast-iron pipe, and specials; (H)—For the supply and delivery of 20 hydrants, 29 gate valves and boxes; (J)—For the erection of power station; (K)—For the supply, delivery and installation of heating plant. Complete sets of plants and specifications may be seen at the office of the consulting engineers, Murphy & Underwood, Saskatoon, Assiniboia, Sask.

Personal

Samuel Grover Veary, late chief mechanical engineer Montreal Waterworks, died in Montreal on August 2, aged 75.

C. H. Speer has been appointed chief engineer of the Algoma Steel Corporation, in succession to J. D. Jones, who has resigned.

G. M. Smith, formerly of Lytle, Smith & Co., Montreal, has recently taken over the managership of the Precision Tool Co., 1665 St. James Street.

Captain Hiram Rowe, a retired mariner of the Great Lakes, passed away at his residence in Collingwood, Ont., on August 5, aged 72 years.

A. E. Griffin, of Wingham, Ont., is going to Russia in the interests of the Forley, Walsh & Stewart Railway Construction Co., of Vancouver, and expects to secure a contract for his company in that country.

J. A. Kilpatrick, president and manager of the Dominion Wheel & Foundry Co., of Toronto, and formerly of St. Thomas, has been appointed by the Imperial Munitions Board at Ottawa to take charge of the production of forgings.

Thomas J. Drummond, a prominent business man of Montreal, and a member of the Drummond, McCall Co., died at his summer residence at Castine, Me., on August 6. Mr. Drummond was born at Tawley, County Leitrim, Ireland, on September 26, 1860.

C. Stendol has been appointed manager of the steel department of the Canada Cement Co., Montreal, in succession to C. H. McMillan, who has resigned. Mr. Stendol was formerly with the Dominion Steel Corporation, and previously held an important managerial position with the Algoma Steel Co., Sault Ste. Marie, Ont.

Captain F. Ross Newman has been invalided to England, suffering from trench fever. He has been at the front for some fifteen months, having gone there with a Toronto battalion which formed a unit of the 2nd Canadian Overseas Contingent. Previous to enlistment, Captain Newman was sales manager at Toronto for the Canadian Fairbanks-Morse Co.

John D. McEachren, a former well known manufacturer of Galt, Ont., died recently at Indianapolis, Ind. The late John D. McEachren was in his 81st year and was born in St. Croix, Quebec. He came to Galt from Harriston and after being engaged in various pursuits for several years, founded the McEachren Heating and Ventilating Co., now Sheldons, one of the largest plants manufacturing heating and ventilating machinery in Canada.

Brig.-Gen. Sir Alexander Bertram, deputy chairman of the Imperial Munitions Board, will visit the West during the next few weeks in connection with the output of munitions, and particularly the production of certain raw materials, such as copper. He will visit copper mines in British Columbia with a view to expediting shipments. After returning from the West, General Bertram will in all likelihood accept an invitation to cross the ocean and visit the battle front.

Contracts Awarded

Quebec, Que.—The City Council have awarded a contract for batteries for the fire alarm telegraph system to Goulet & Belanger at $3,041.

The Boving Hydraulic & Engineering Co., Lindsay, Ont., have been awarded a contract for water turbines by the City of Sherbrooke, Que.

Quebec, Que.—Goulet & Belanger, of this city, have been awarded the contract for the Quebec Exhibition lighting system. Estimated cost, $11,000.

Hamilton, Ont.—The United Gas & Fuel Co. have awarded a contract for the equipment of their new plant here to the Gas Machinery Co., Cleveland, Ohio.

Iroquois, Ont.—The Village Council have awarded a contract to the Swedish General Electric Co., Toronto, for a 125 kw. generator with exciter and switchboard.

Toronto, Ont.—Witchall & Son, Toronto, has received the contract for the erection of an ice plant for the William Davies Co., Front Street East, to cost $50,000.

Edmonton, Alta.—Nesbitt & Co., Edmonton, have been awarded the contract for the erection of a machine shop at Edmonton for the C. N. R. at a cost of $19.500.

Chatham, Ont.—Wells & Gray, Toronto, have been awarded the contracts for the addition to the American Pad & Textile Co. factory here.

Prince Rupert, B.C.—The City Council have awarded a contract for pumping equipment to the Canadian Fairbanks-Morse Co., and for steel pipe to Campbell Gordon & Co., Vanvouver, B.C.

New Toronto, Ont.—The general contract for the erection of a factory for the Goodyear Tire and Rubber Co., has been let to the Dominion Construction Co., Toronto. Approximate cost, $750,000.

Niagara Falls, Ont.—The Town Council has awarded the contract to the Electro Bleaching Gas Co. of New York, for the installation of a liquid chlorine to cost $900. The plant of this company is in Niagara Falls, N. Y.

Port Arthur, Ont.—The Thunder Bay Contracting Co. of Port Arthur was recently awarded the contract for the basement and cement work on the new Canadian Government railway elevator to be erected at Transcona, Man.

Ottawa, Ont.—The contract for the construction of the new Customs house and examining warehouse at Toronto has been awarded to the Fuller Construction Co. The buildings will cost about $1,500,000, and are to be started at once.

Arnprior, Ont.—The Galetta Electric Power & Milling Co. have awarded a contract for a turbine to the Boving Hydraulic & Engineering Co., Lindsay, Ont. A 400 kw. generator and additional switchboard equipment will be supplied by the Canadian Westinghouse Co., Hamilton, Ont.

Victoria, B.C.—The contract for the 450 or 500 tons of steel to be used in the construction of the three ships being built in the local shipyards of the Cameron- Genoa Mills Shipbuilders, has been secured by the Victoria firm of Messrs. F. G. Prior & Co. The steel which will be required under the contract will consist of bars, bolts, rings, rivets, etc., and the whole order for the three ships will be delivered on the ground within six weeks' time.

Trade Gossip

Laurie & Lamb, Montreal, have received an order for a 500 h.p. Belliss & Morcom engine for the Belgo-Canadian Pulp & Paper Co., Shawinigan Falls, Que.

CELFOR

Our Competitor's Argument

One of our competitors—one for whom we have much respect—one who manufactures both high-speed and carbon drills—in some recent advertising shows conclusively that it is profitable to use high-speed rather than carbon drills, *even at ten times the cost.*

Our Competitor's Figures

High-speed drills cost ten times carbon drills, with present high prices of steel.

High-speed drills will do five times the work of carbon drills—a very conservative comparison.

But assume they will do only four times the work—ultra conservatism—

Cost of Drilling 10,000 Holes

WITH CARBON DRILLS		WITH HIGH-SPEED DRILLS	
20 Carbon Drills @ $1.00	$ 20.00	5 H. S. Drills @ $10.00	$ 50.00
20 Men @ $2.50 per day	50.00	5 Men @ $2.50 per day	12.50
100% *Machine Expense	50.00	100% *Machine Expense	12.50
Total Cost	$120.00	Total Cost	$ 75.00

*Machine expense includes taxes, insurance, depreciation, repairs, power, etc.

Our Competitor's Conclusion

"When you are using drills of ⅜" or over, if your equipment is favorable, we sincerely recommend the high-speed drill."

Our Conclusion

We heartily endorse our competitor's conclusion—and we sincerely hope he will not take offense at our use of his argument.

This sounds like humor—but it is not—it is fact.

We Manufacture High Speed Drills

CELFOR TOOL COMPANY

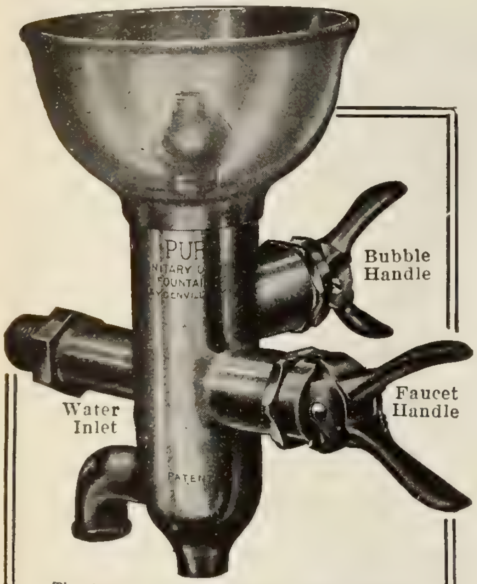
BUCHANAN, MICHIGAN

I BELIEVE

In Safety First and always.
In providing for the Health of my Fellow Workmen.
In Light and Air and sanitary Working Conditions.
In clean, fresh drinking water for everybody.
In the Safety, Economy and Man-betterment.

PURO SANITARY DRINKING FOUNTAIN

(MADE IN CANADA)



The loss of a man through impure drinking water is a crime that "the front office" must bear.

An ugly statement, isn't it? But true, absolutely.

When a man comes to work in your factory he puts his health in your keeping.

Are you willing to take chances on such a trust?

Impure drinking conditions are responsible for more tragedies than any machine ever built.

Apply the "Safety First" Principles to your water supply; don't deny your men a clean, fresh drink of water.

Conserve their health and they will improve your profits; make yourself as worthy of the name of "employer."

Install the Gold Medal winner Puro in your plant, office and shop alike.

The only Sanitary Drinking Fountain that is safe, sanitary, simple, automatic in control and easily attached.

Let us tell you just what it will cost you to

Stampings and Metal Specialties

We have the plant and equipment for turning out stampings of the highest quality in brass, copper, aluminum, tin and steel, and are prepared to undertake the manufacture of metal specialties of any description.

PUNCHES, DIES, TOOLS.

COLEMAN FARE BOX COMPANY, LTD.
70 Bond St., Toronto

Galt, Ont.—The annual excursion of the Mutual Benefit Society of the Canada Machinery Corporation Works to Burlington Beach on July 29 was a decided success.

The Canadian General Electric Co., Toronto, have been awarded a contract for a 5,000 k.v.a. turbine and generator, condenser and pumps, etc., by the Acadia Coal Co., Stellarton, N.S.

The Canadian Westinghouse Co., of Hamilton, Ont., have been awarded a contract by the Great Lakes Power Co., of Sault Ste. Marie, Ont., for the electrical equipment for their new power plant.

The International Time Recording Co. has been incorporated at Ottawa, with a capital stock of $500,000, to manufacture time clocks, etc., at Toronto. Incorporators: E. B. Ryckman, A. L. Reid and S. G. Wharin, all of Toronto.

Ottawa, Ont.—The corner-stone of the new Parliament Buildings will be laid by his Royal Highness the Duke of Connaught on September 1 next. This date was fixed by the Parliamentary Reconstruction Committee owing to the fact that it was on September 1, 1860, that the corner-stone of the old building was laid by the late King Edward.

The Smithsonian Institution, Washington, D. C., announces that it has made an appropriation to further experiments in the dissipation of fog by electricity and that the investigations will be carried out under the general direction of Dr. F. G. Cottrell, who has already done much toward the practical precipitation of dust, smoke and chemical fumes in large industrial establishments.

Saguenay Railway Taken Over.—The agreement between the Government and the owners of the Quebec & Saguenay, Quebec, Montmorency & Charlevoix, and Lotbiniere & Megantic Railways for the taking over of the three roads was finally signed up at a meeting of the Cabinet Council on August 2. The agreement is along the lines of the legislation passed last session. The total amount to be paid over amounts to about $7,000,000. The Government will proceed as soon as possible with the completion of the Quebec and Saguenay road.

Canadian Munitions Plant for Women.—The Gooderham & Worts Distillery at Toronto is being turned into a munitions plant for women operators, through the generosity and patriotism of Col. A. E. Gooderham. In the reconstruction and equipment arrangements every possible comfort has been provided for the women employees. The latter will operate on three shifts of eight hours each. Motors will call to

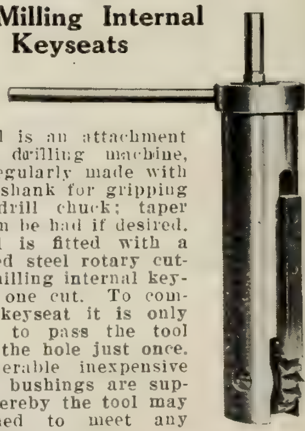
KEYSEATER

for Milling Internal Keyseats



This tool is an attachment for the drilling machine, and is regularly made with straight shank for gripping in the drill chuck; taper shank can be had if desired. The tool is fitted with a high-speed steel rotary cutter for milling internal keyseats in one cut. To complete a keyseat it is only required to pass the tool through the hole just once. Innumerable inexpensive eccentric bushings are supplied whereby the tool may be bushed to meet any diameter above its own.
Write for Catalog C for full detail.

NATIONAL MACHINE TOOL CO.
2270-2272 Spring Grove Avenue, Cincinnati, Ohio, U.S.A.

Agents: The Canadian Fairbanks-Morse Co., Ltd., Montreal, St. John, Toronto, Winnipeg, Calgary, Vancouver, Ottawa, Quebec, Hamilton, Saskatoon and Victoria.

KINDLY MENTION THIS PAPER WHEN WRITING TO ADVERTISERS.

take them to their employment, while gas ranges will stand ready to produce cups of tea and other sustenance; in short, nothing will be left undone to make the work as easy and as congenial as possible. The matron appointed has been given carte blanche to carry out such ideas as occur to her along this line.

Building Notes

Barrie, Ont.—The Bell Telephone Co. will erect a new exchange building here. Contracts will be awarded shortly.

Toronto, Ont.—Mongee & Co. have been granted a permit for an addition to their premises at 334 Parliament Street to cost $4,000.

Toronto, Ont.—The Harry Webb Co. has received a permit for the erection of a bakery to cost $78,000, at the corner of Kendal Avenue and Davenport Road.

Toronto, Ont.—The city architect has approved the plans and issued a permit for the erection of a twelve-storey factory building by the T. Eaton Co., on Alice Street, to cost $625,000. The building will be of reinforced concrete fireproof construction.

Toronto, Ont.—A new moving picture theatre will be built at 141 and 143 Yonge street by L. J. Applegath & Sons for His Majesty's Theatre Co., and will cost $100,000. Plans are being prepared by F. W. Lamb, a New York architect. It will be absolutely fireproof and will have a seating capacity of 1000.

Toronto, Ont.—The Toronto Hydro-Electric Commission are having plans prepared for the erection of a large stores building at the corner of Murray Street and Caer Howell, to cost between $200,000 and $250,000. When the need arises the building will be enlarged, and it is expected that when complete it will be worth $400,000.

Halifax, N. S.—The French Cable Co., of Paris, has awarded to the Standard Construction Co., of Halifax, the contract for construction of one of the finest cable buildings in America, to be erected on the North Dartmouth shore. The contract calls for construction of wharf and building, involving an expenditure of $70,000. The building will be three stories in height, and 260 feet by 140 feet.

Wood-Working

Fesserton, Ont.—The stave and saw mills of the Fesserton Timber Co. here were totally destroyed by a fire on Saturday night.

34" x 16' Blaisdell, c.r.
36" x 28' American, c.r.
42" x 24' Fifield, c.r.

SCREW MACHINES.

Pratt & Whitney No. 1 friction gear.
1 3-16" Hartford Automatic.
2" Cleveland Automatic.
2¾" Cleveland Automatic.

BORING MILLS.

52" Niles, car wheel.
48" Colburn, two heads.
60" Colburn, vertical, two heads.
51" Bullard, two swivel heads with motor drive and motor.

PLANERS

Morton Portable.
17" x 17" x 12' Whitcomb, crank.
22" x 22" x 6' Gray, one head.
24" x 24" x 4' New Haven, one head.
24" x 24" x 6' Pond, one head.
24" x 24" x 6' Gray, one head.
30" x 30" x 8' Woodward & Powell, one head.
36" x 36" x 10' Powell, one head.
36" x 36" x 12' Powell, two heads.
36" x 36" x 16' Sellers, one head.
39" x 39" x 12' New Haven, one head.
40" x 40" x 12' New Haven, one head, one side head.
54" x 54" x 14' Pond, two heads, arranged for motor drive.

MILLING MACHINES.

No. 12 B. & S., plain.
No. 2 Cincinnati, plain.
No. 2 P. & W., Lincoln Type.
No. 23 Fox Miller.
No. 13 P. & W., Lincoln Type.
Garvin No. 1½ Universal.
No. 3 LeBlond, plain

GEAR CUTTERS.

24" x 7" Gould & Eberhardt, for spur gears.
24" x 9" Gould & Eberhardt, for spur, bevel and face gears.
36" Walcott.

SHAPERS.

15" Hendey, friction.
16" Niles, back-geared.
18" Barker & Chard, back-geared.

HAMMERS.

100-lb. American, steam post.
100-lb. Pittsburg, single frame, steam.
200-lb. Bliss, drop.
300-lb. Bliss, drop.
800-lb. Morgan, single frame, steam.

PRESSES.

No. 77A Toledo, o.b., straight side.
No. 3 Bellvouk & George, o.b., inclinable.
No. 3 Toledo, o.b.
No. 430 McDonald, double crank.
No. 133 Ferracute, double action.
No. 95 Bliss, double crank.
No. 77A Toledo, o.b.

DRILLS.

5' Dreses Full Universal Radial.
3' Economic Plain Radial.
2½' Dreses Radial.
No. 30-C Baush, 12-spindle.

MACHINE TOOLS - THE VERY BEST

GRINDERS.

Two (2) 14 x 72 Norton, plain, excellent condition, modern type, each	$2500
Two (2) 10 x 72 Norton, plain, excellent condition, modern type, each	2200
12 x 36 Cincinnati Universal	1250
No. 3 Brown & Sharpe Universal 12 x 50	2000
No 60 Heald Cylinder	1000
Landis plain, 8 x 38	1400
Springfield Universal, 16 x 40	850
Two (2) No. 5 Rivet, each	750
No 3 Brown & Sharpe Cutter Grinder	300
No. 7 Geo. Gorton, double end disc grinder with wheel chuck on one end, steel discs and tilting table	300
Diamond Side Type Shop Face Grinder, working surface of table 9" wide x 2' long, cup wheel 14" dia.	300
Wells Cutter Grinder	75
No. 1 Peerless Surfacing Machine, 10" belt	75
Plain Grinders, Wet Tool Grinders, Polishing Machines, large and small.	

HAND MILLING MACHINES.

Two Chicago, each	200
Pratt & Whitney No 2	175
Four Pratt & Whitney No 1, each	125
Two No. 2 Garvin, each	150
Two No 3 Garvin, each	175
Six Pratt & Whitney, No. 1½, each	175
Two Pratt & Whitney Hand Millers	[illegible]
Reed	150
Pratt & Whitney	150
Pratt & Whitney, with vise	150
Two Pratt & Whitney	[illegible]

HORIZONTAL BORING MACHINES.

No 2 Beaman & Smith Combination Boring, Drilling and Milling Machine; good as new	5000

HORIZONTAL BORING MACHINES (Continued)

Beaman & Smith No. 8, 5" spindle	$3500
Bement & Dougherty No. 3, Knee Type, 3¾" bar	1450

PLANERS.

48 x 48 x 20' Putnam, 2 heads on rail; excellent condition.	3500
36 x 36 x 14' Powell, 2 heads on rail	1750
32 x 32 x 10' Gleason, single head; good as new	700

LATHES.

60 x 28' Fifield, raising blocks to swing 75", double back-geared, face plate drive, dia. of face plate 56" x 8'; good as new	[illegible]
50 x 20' Fifield, Massive Pattern, 48" four-jawed chuck....	2750
52 x 16' Gleason, heavy triple-geared, faced plate drive	2500
24 x 18' Lodge & Shipley, quick change gear, taper, motor driven, carriage control	2000
16 x 8' Pratt & Whitney, quick change gear, taper attachment, H.S., C.R.; good as new; latest type	1000

MULTIPLE SPINDLE DRILLS.

Baush 8 spindle, 1¼" points	1150
Foote Burt 8 spindle, spindles adjustable on rail, center to center outside spindle 6 max	800
Snyder 28" 4 spindle, back geared, sliding head, table 30" long, 16½" wide	300
Five (5) Cardan 4 spindle, each	250
No. 11 Pratt & Whitney 15 spindle	325
Two 14" Barr 3 spindle Sensitive, each	[illegible]
No 11 Pratt & Whitney, 10 spindle	225
2 spindle Barr	60
Baush 16 spindle	750
Three 4 spindle Fenn Sensitive, adjustable heads, each	150
Allen 4 spindle	250
Henry & Wright 3 spindle	200

SHAPERS.

30" Merton Draw Cut
24" Smith & Mills Crank
24" Gould & Eberhardt Crank
20" Heavy Duty American Crank
16" New Ohio Crank
15" Gould & Eberhardt Crank
14" Sellers, traveling head.

BORING MILLS.

62" Baush Vertical, two heads.
60" Bement-Miles Vertical, two heads.
60" Bement Vertical, one head.
50" Bement-Miles Car Wheel Mill.
36" Bridgeport Vertical, two heads.
30" Baush Vertical, turret head.
Barrett Horizontal, 3" bar
Beaman & Smith 2-Spindle.
Underwood New Cylinder Mill, 3⅝" bar.

MILLING MACHINES.

No. 2 Cincinnati Universal.
Ingersoll Slab, adjustable rail, platen 3 ft. x 12 ft., three heads.
No. 1-B Milwaukee Late Type Plain, Universal dividing head, chuck, vise.
76" Newton Heavy Duty Vertical, 48" circular table.
Newton Slab, platen 18" wide, 10 ft. long.
No. 1 Cincinnati Plain.
No. 2 Kempsmith Plain.
No. 9 Kempsmith Plain.
No. 1 Brainard Plain.
Detrick & Harvey Milling, Drilling and Boring.
Garvin Plain, No. 4½, No. 4, No. 3.
Newton Plain, table 7¼" x 36".

RADIAL DRILLS.

6' Pond Plain.
5' Bickford Semi-Universal.
3' Bickford Plain.
3' Fosdick Plain, tapping attachment.

KEYSEATERS.

Baker Bros., 24" stroke.
Baker Bros. Colburn, 20" stroke.
No. 2 Mitts & Merrill, 13" stroke.
No. 0 Mitts & Merrill, 7" stroke.
No. 2 Davis, 4" stroke (2).

PRESSES.

DG-56 Ferracute, 4" stroke.
No. 1 Bliss, 8" stroke.
No. 4 Bliss Geared Double Crank, 3" stroke.
No. 2 Bliss Double Crank, 2" stroke.
Farrell Press, 2" stroke.
PG-6 Ferracute, 1½" stroke.
No. 4 Farrell, 1½" stroke.
Bliss Pillar Press, 1½" stroke.
Fowler, 1¼" stroke.
No. 3 Manville Stamping, 1" stroke.
350-ton Hoe Hydraulic.
200-ton Robertson Hydraulic.
100-ton Sellers Hydraulic Wheel Press.

PUNCHES AND SHEARS.

Sellers Double Angle Shear, capacity 8" x 8" x 1".
8' Lennox Rotary Splitting Shear, split 16' plates.
Lennox Rotary Splitting Shear, split 12' plates.
Cleveland D. E. Punch and Shear, 26" throats.
Bement Plate Iron Shear, 26" throat.
Bement Punch, 31" gap.
Cockburn & Barrow Punch, capacity 1" in 1".
Kling Bros. Punch, 24" throat.
Reed Cleveland Punch, 22" throat.
Bass D. E. Punch and Shear, 20" throats.
Wilson Kalamazoo D. E. Punch and Shear, throats 6".
Style D Long & Alstatter Shear, capacity 3½" round stock.
No. 10½ Badger State Punch and Shear.

"Keep Wheels Dressed" is just as important as "Keep Tools Sharp"

Diamo - Carbo Grinding Wheel Dressers are the economical substitute for the Black Diamond Dressers. They are so low priced that each grinding stand may be provided with its own Dresser. Sherman Huntington For use on large and coarse wheels upon which the Diamond cannot be used, the Sherman Huntington is the most satisfactory Dresser ever designed. Made in three sizes with either Corrugated or Toothed cutters. The No. 2 with Cutters 2⅜" in diameter is a wizard for use on the hardest wheels. Provided with hood to protect user from flying particles.

We also manufacture Diamond Dressers

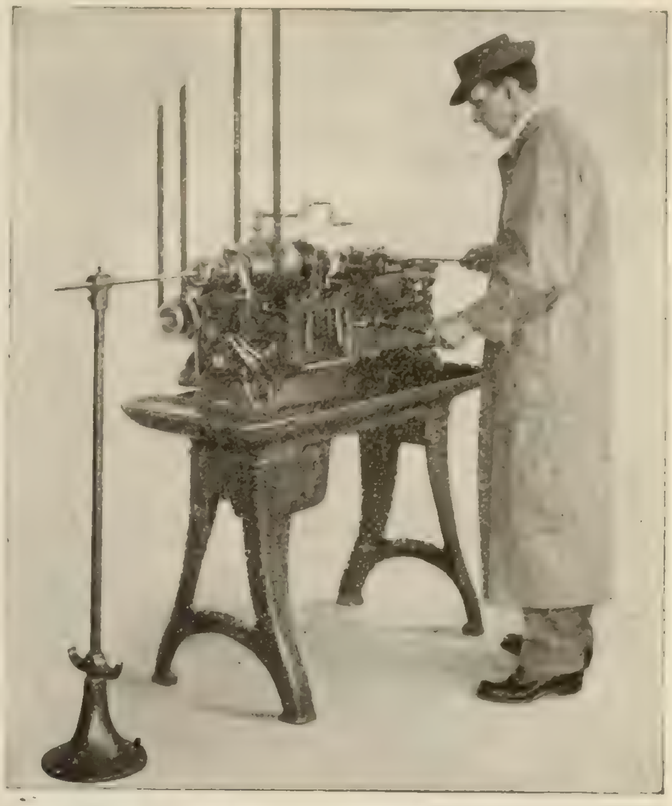
READ PAGE 66



Not a Wasted Motion on This Screw Machine

The Operator controls all movements of the Turret and Cross Slide Tools, also the Automatic Stock Feeding Mechanism with these Two Levers.

The chuck and stock feeding mechanisms are operated together by power, insuring quick action and relieving the operator from tugging on stock feed levers. The mechanism is tripped to operate by continuing to push the cross slide lever forward with the left hand after the finished piece is cut off. The right hand lever serves to index and lock the turret and feed the tools to the work. The operator's hands do not leave these two levers, hence there are no false motions to add seconds to the production time per piece. But handiness of operation is only one point in favor of

Brown & Sharpe Wire Feed Screw Machines

When considering a machine of this type an important point is often overlooked—how long it will give efficient service. Long wearing qualities are not always apparent on the surface or in the specifications. In the consideration of first cost it should be borne in mind that B. & S. Wire Feed Screw Machines offer the maximum in length of service. The materials and workmanship best suited to withstand hard usage are put in every part of the machines.

IS YOUR RIVETING PROFITABLY DONE?

Our Elastic Rotary Blow Riveting Machine does profitable work, because one machine will do the work of several hand riveters, and do it better.

Every head is perfectly formed, any shape, round, flat, oval, rectangular, etc.

Catalogue C tells more about it.

$469.20 a Year for National Advertising

A half page advertisement in MacLean's Magazine, every issue for a year (12 times), costs $469.20.

Figured out proportionately, it means:

$164.22	to influence	Ontarians,
$102.00	" "	Quebecers.
$ 23.46	" "	New Brunswickers.
$ 28.15	" "	Nova Scotians.
$ 4.69	" "	P.E. Islanders.
$ 32.84	" "	Manitobans.
$ 37.51	" "	Saskatchewans.
$ 28.15	" "	Albertans.
$ 28.15	" "	British Columbians.

(This division on the basis of provincial populations.)

Really, when you break it up this way, the amount per province for a whole year's powerful influence is ridiculously small.

Honestly, can you say "I can't afford $469.20 a year for national advertising?"

MACLEAN'S MAGAZINE

Can perform a service for you, at a price, which you cannot have rendered by any other single medium, or at so low a cost.

N.P. Objectionable advertising not accepted. Both editorial and advertising columns are closely censored to keep them clean and decent.

Published by
The MacLean Publishing Co., Limited
143-153 University Avenue, Toronto, Ontario

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers.

We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.

We can finish steel stamping in Nickel, Brass or Copper.

Send us a sample order.

W. H. BANFIELD & SONS
372 Pape Avenue, Toronto, Can.

"HAWK'D" CHROME VANADIUM STEEL

Will Give You Exceptional

Shell Forging Production

WITHOUT AN EQUAL FOR BOTH FIRST AND SECOND OPERATION PUNCHES.

Comes to you heat-treated and ready for use.

It does not stick to the work.

There are many cases where each punch has turned out over 2,000 shells.

It means more shells, per machine per day.

STEEL OF EVERY DESCRIPTION.

OIL AND WASTE RECLAIMING MACHINES

D'Olier Centrifugal Pump & Machine Co., Philadelphia, Pa.

Stephen Leacock

contributes an article "Is Permanent Peace Possible?"—an excellent summary of conditions governing international relations.

Robert W. Service

supplies another of his wonderful war poems "The Flowers," written at the front, where he is driving a motor ambulance.

Agnes C. Laut

writes on "Business--and the Fatal Spiral," an excellent article dealing with a serious condition in business which has developed.

Arthur Stringer
Arthur E. McFarlane
L. M. Montgomery

These three well-known Canadian authors give brilliancy and distinction to the fiction contents.

H. F. Gadsby

contributes an article on Dr. Michael Clark, M.P., the Free Trade advocate of the Commons.

All in the August issue of MacLean's Magazine, together with a dozen other features, and the Review of Reviews department. Get a copy at your news-stand, or, better still, send in your subscription. Yearly subscription price, $1.50.

A Trip through the Globe Shop

FREE

This Brochure Takes the Place of a

personal trip through our shops.

The actual scenes from the factories, and the few words of explanation, tell you those things that you wish to know.

It tells the whole story interestingly and without taking up much of your time.

SENT FREE—NO OBLIGATION

Mention Canadian Machinery

The Globe Machine & Stamping Company
CLEVELAND, OHIO

BE READY

If you wish to take advantage of the extensive "Made in Canada" campaign, prepare to meet competition by consulting our expert engineer for the manufacturing of your special machinery.

Hendey Experimental 12" Lathe

For the Laboratory or Experimental Department where the best of its kind is wanted, and each machine must be motor-driven, here is the Lathe in this HENDEY 12".

In addition to its complete regular equipment it has Small Tool Cabinet for operators' fine tools, also gear closet for extra gears to cut special threads.

Write for Descriptive Matter.

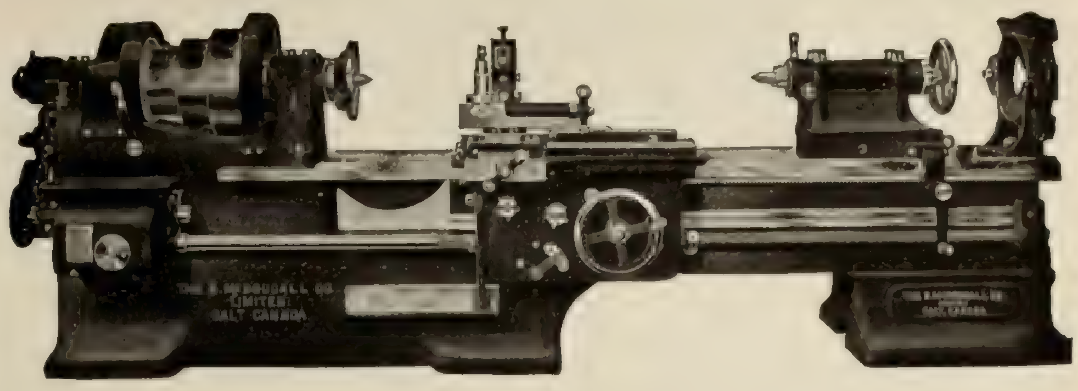
McDougall Gap Lathes

Strength
Accuracy
Quality



Take a look at the next money you intend to invest in a Lathe. Then, take a look at the money's worth we offer you in our machine. Your money will soon come back to you in increased production and we will have the pleasure of having a satisfied user. Our machines are just as good as they look and they look good too.

We invite the closest inspection.

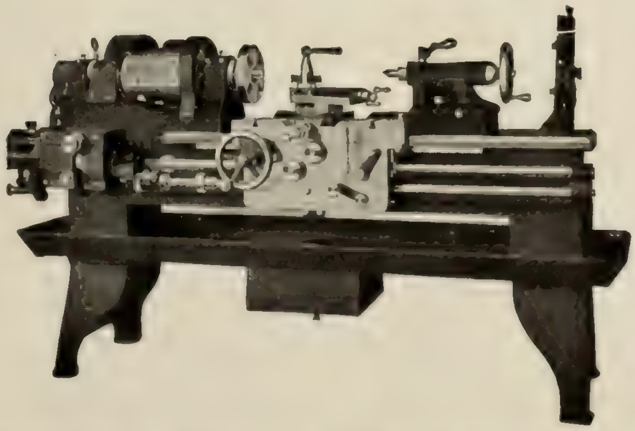
ARE-MAC-DEE IS A GUARANTEE

Particulars on request.

The R. McDougall Company Limited

Manufacturers
GALT, Ont., Canada
The Canadian Fairbanks-Morse Co., Limited, Sales Agents.

In Stock for Immediate Delivery



- [illegible] x 8 [illegible] Heavy Duty Lathes, with turret on carriage, for 4.5 and 6" shells.
- [illegible] x [illegible] Cincinnati Lathes, 5-step cone, double back gear.
- 1 [illegible] x 14 [illegible] Turret Lathe, for 8, 9 or 12" shells.
- [illegible] x 10 American Quick Change Gear.
- [illegible] x [illegible] [illegible] Tool Room Lathe, complete with draw-in collets and taper attachment.
- [illegible] x 8 [illegible] All-geared Turret Lathe.
- [illegible] x 20 Lodge & Shipley Quick Change Gear Lathe.
- [illegible] x 8 [illegible] Screw Cutting Lathes.
- 1 8" [illegible] Lathe, back-geared, power feed, draw-in collets, grinding and milling attachment.
- [illegible] No. 1 [illegible] Turret Screw Machine, power feed.
- [illegible] x 8 Sidney [illegible] Engine Lathes.
- [illegible] x 8 Foster Geared Friction Head Turret Lathes.
- 1 [illegible] Sibley Drill, back-geared, sliding head.
- 6 24" [illegible] Drill Presses, back-geared, sliding head.
- 5 30" Back Geared Drill Presses.
- 1 14" [illegible] 4 Spindle Sensitive Drill Press.
- [illegible] 18" Woodward & Rogers [illegible] Spindle Sensitive Drill Presses.
- 1 [illegible] [illegible] Sensitive Drill Press.
- [illegible] 14" Perfect Sensitive Drill Presses.
- 1 20" Oesterlein Plain Automatic Milling Machine, complete with vertical and slotting attachment.
- [illegible] Rockford Plain Milling Machine, complete with vise, index centers, slotting and vertical attachment.
- 2 Ford Smith Plain Milling Machines, with vise.
- 1 12" Kempsmith dividing head.
- 1 No. [illegible] Oesterlein Universal Grinder, complete with regular equipment.
- 1 No. 1 Diamond Surface Grinder, 12" x 24" x 9".
- [illegible] No. 2 Diamond Surface Grinder, 6" x 12" x 9".

THE FOSS & HILL MACHINERY CO.

305 ST. JAMES STREET - - - - MONTREAL, QUE.

C.M.C.

Registered Trade-Mark of the Canada Machinery Corporation, Ltd.

The Mark of Distinction in Machine Tools

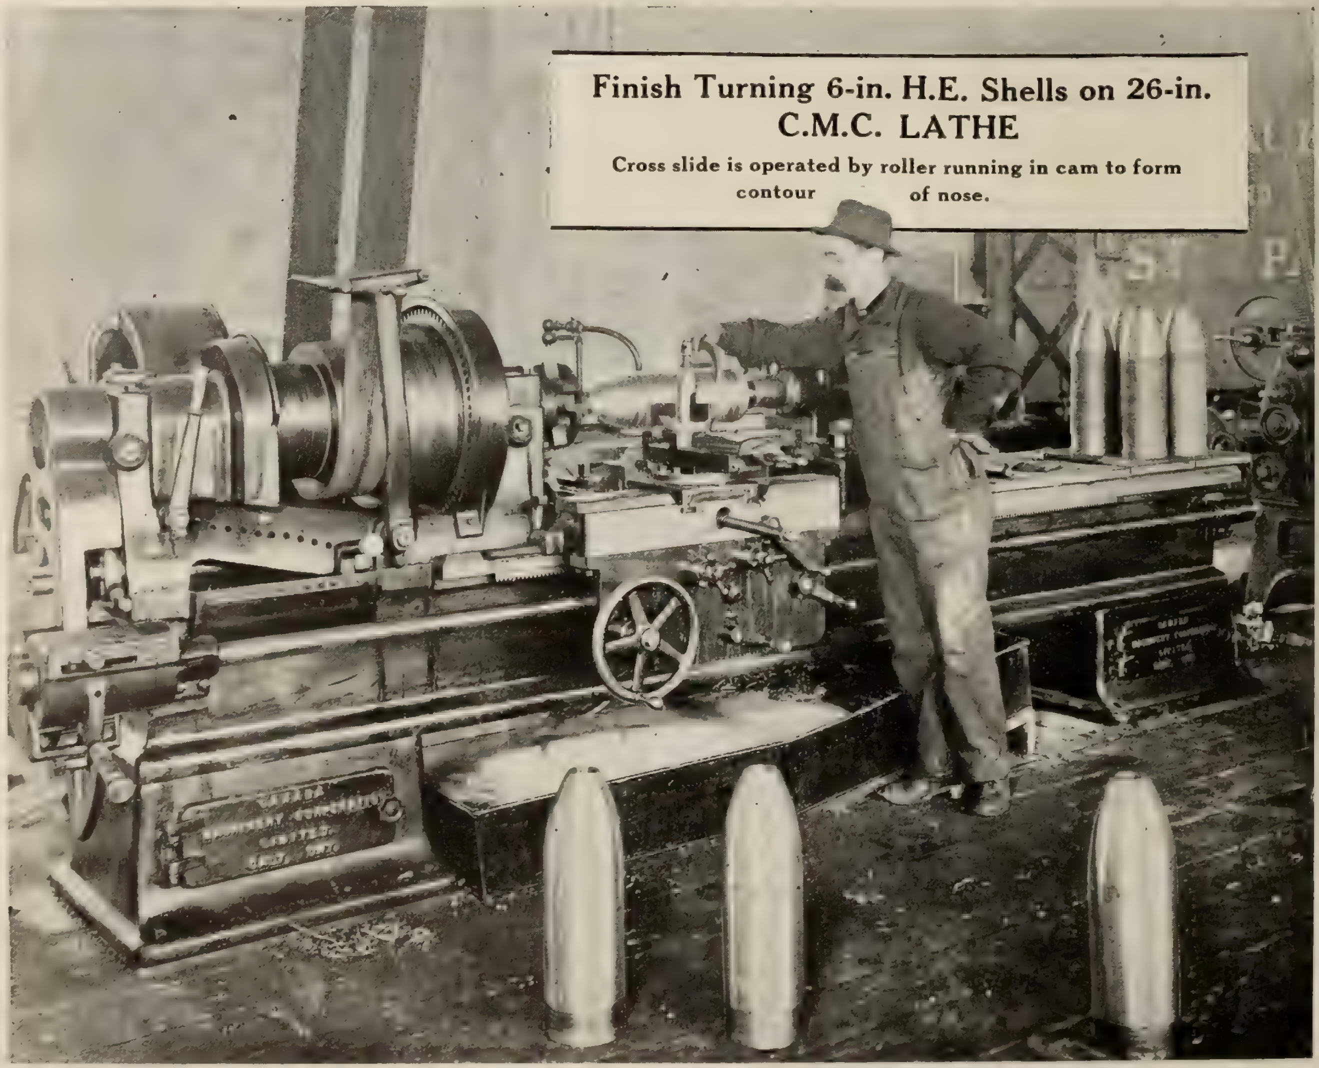
YOU will find "C.M.C." lathes in practically every munition plant in Canada. Their power, rigidity and accuracy have made them general favorites.

LONG experience, high-grade workmanship and the best materials are represented in all machine tools (iron or woodworking) bearing the trade-mark shown above.

CANADA MACHINERY CORPORATION, Limited

Galt, Ontario

For convenience of the trade we have opened Showrooms in Toronto at Brock Avenue Subway, where a full line of our Machinery can be inspected.



Finish Turning 6-in. H.E. Shells on 26-in. C.M.C. LATHE

Cross slide is operated by roller running in cam to form contour of nose.

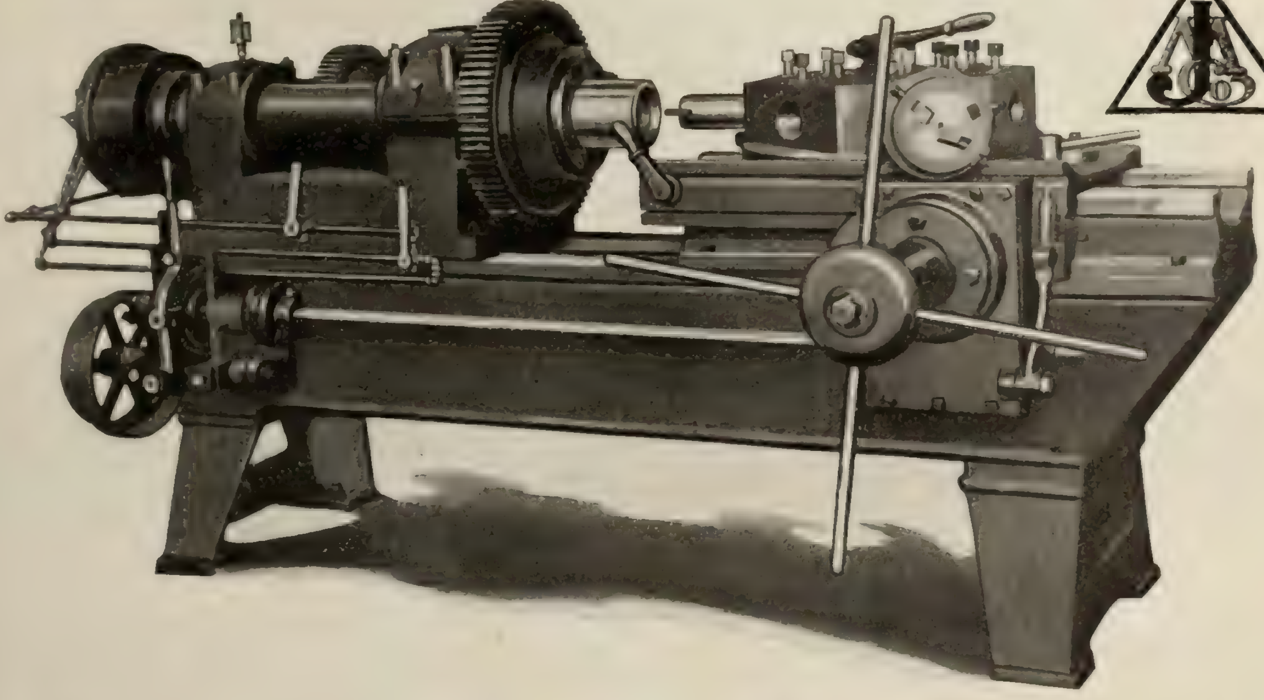
CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by The MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

Vol. XVI—No. 7 Publication Office: Toronto, Aug. 17, 1916 Subscription Price $3.00 per Year



This machine is built for base facing, or boring the 6" shell. It is made with a 6 side turret and being compound geared has a very powerful drive.

Very rapid, making possible heavy production, the feed is by means of a worm and gearing in the apron.

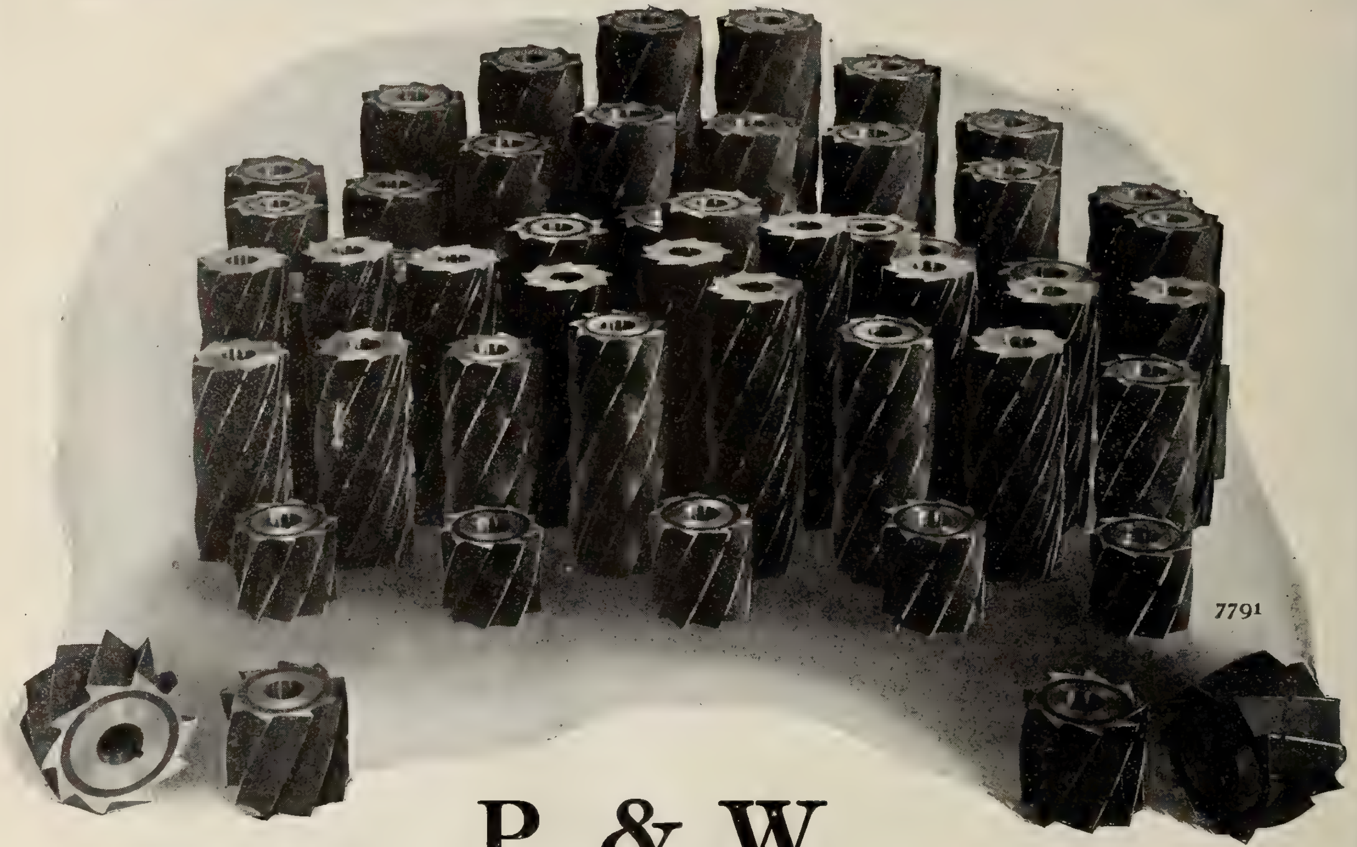
The Answer to Your
Heavy Duty Cutter Problem



P. & W.

Coarse-Tooth High-Speed Milling Cutters

We are prepared to furnish promptly coarse-tooth milling cutters of High Speed Steel adapted primarily to the heavier class of milling.

Long Life. Such cutters have the advantage of long life as the large teeth permit of more grindings. It will also be seen that less time is required to sharpen.

Increased Production. The ample chip room insures a remarkably free cutting action and will increase production by a high percentage with less power required to drive.

Strong Teeth. The teeth being larger are exceptionally strong and will easily stand the heaviest feeds without breaking.

Place a trial order with our nearest store.

Advertising Machine Tools

By "Publicity" Manager in *Page's Engineering Weekly*

DURING the last ten years it has been my privilege to study the results obtained from various forms of advertising Machine Tools, and as far as it is possible to do so, collect data to form a basis of future propaganda.

¶ As far as advertising in the recognized Trade Organs is concerned, this is absolutely essential, no matter what additional system may be carried out, as it is now the general practice of Works Managers and buyers to carefully peruse the advertising columns of the leading engineering journals; and, as I do myself, to preserve in a "Folder" the actual advertisements of special or new tools.

¶ In trade paper advertising a good half-tone illustration, as large as the space will permit, is essential. No amount of "copy," even if cleverly laid out, is of much value without a picture, which really is the "eye catcher." The value of a good descriptive illustration was brought vividly to my notice some years ago by the receipt of an order for a machine tool costing almost £1,000 from an Overseas government department, the machine having actually been decided upon from the illustration and copy in the advertisement.

¶ I have also noted good results from the "series" form of advertising, i.e., running a particular Machine for a number of insertions instead of changing the copy and illustration every insertion. The continuity of an illustration tends to impress the Machine on the mind of the prospective purchaser, and results in increased sales.

¶ A fault which many firms are liable to is to make "General" claims in their advertising copy. One quite commonly comes across such a statement as this in an advertisement:

> ¶ "A first-class machine, built on good lines, with many labour-saving movements."

¶ This, of course, conveys nothing to the mind of the buyer, and compares badly with copy such as I have before me at present, reading:

> ¶ "This machine, operating with a 2 in. drill at 200 r.p.m., has been tested to drill a 5½ in. diam. hole in mild steel block at 4.16 in. per minute."

¶ Here we have something which increases the value of the advertisement twofold, as it enables those interested to determine whether the capabilities of the Tool justify further enquiry.

¶ I am a firm believer in weekly or fortnightly insertions as against monthly; the latter tending to lose their value owing to the long break.

¶ A form of advertising next in favour to trade paper announcements is the "personal" letter. The idea is to select a machine suitable for a certain trade and address a letter, accompanied by an illustration, to each firm, stating the capacity of the Tool, giving a few tests, and stating where it can be seen in operation, naming, if possible, a firm in a similar line of business. It is really wonderful the interest displayed in a machine which has been bought by a competitor, and a good crop of enquiries often result from such a system.

DAWSON'S
LINCORA-BALATA
970 FEET 42 INCHES

Is used and is giving every satisfaction in all parts of the world — in **Engineering Shops** for **Machines,** Dynamos, Fans and Main Drives; in **Laundries, Sawmills, Dye Works, Cotton** and **Woollen Mills, Flour Mills** and **Warehouses** as **Elevators** and Conveyors for gain, coal, sand, rock, ore, etc.

North, South, East and **West** will be found this well-known brand. Output capacity 60,000 feet weekly, and more to follow. The quality cannot be surpassed because the materials used are the best—best cotton, best balata, and in every way

BRITAIN'S BEST

production of its kind.

Linccna Balata Belting is the strongest belt made. Breaking strain 11,700 pounds per square inch.

What Balata is:

A natural gum product which is of exceptional strength and durability, being the most powerful adhesive substance. It is thoroughly waterproof and can be used and exposed under every condition of weather, and, if necessary, can be run in water without trouble or injury.

Avoid imitations—there are other so-called Balata Beltings, but **Lincona** is in a class by itself.

Lincona improves with age.

For Turning, Facing and Milling the Thread on Gas Check Plugs for 6-inch High-Explosive Shells.

THE BANFIELD PLUG MILLER

Patents applied for in Canada and United States

THIS machine is especially designed for finishing base plugs, turning the outside diameter, finishing the face with any camber desired, and milling the thread, all in one chucking, the complete plug being finished in six minutes by unskilled labor.

The machine is equipped with quick draw in collet. Drive pulley 18" x 6", with bronze bush having cut jaw clutch for turning and facing. Worm gear 100 to 1 ratio, with cut jaw clutch for milling, driven by 10" x 1½" flanged pulley. The milling cutter is driven by an 8" x 2½" flanged pulley. Tool post carriage is equipped with power feed (two speeds) having automatic stop. Power feed pump with relief valve driven from worm shaft **(all drives direct from main line shaft)**. Rigidly built, simple and economical to operate.

Weight 1,800 lbs.

For 18 pdr., 4.5 and 60 pdr. High Explosive Shells, Can furnish machines of same type, but somewhat lighter in construction. Particulars on request.

These machines are tooled up for finishing plain machined plugs if desired.

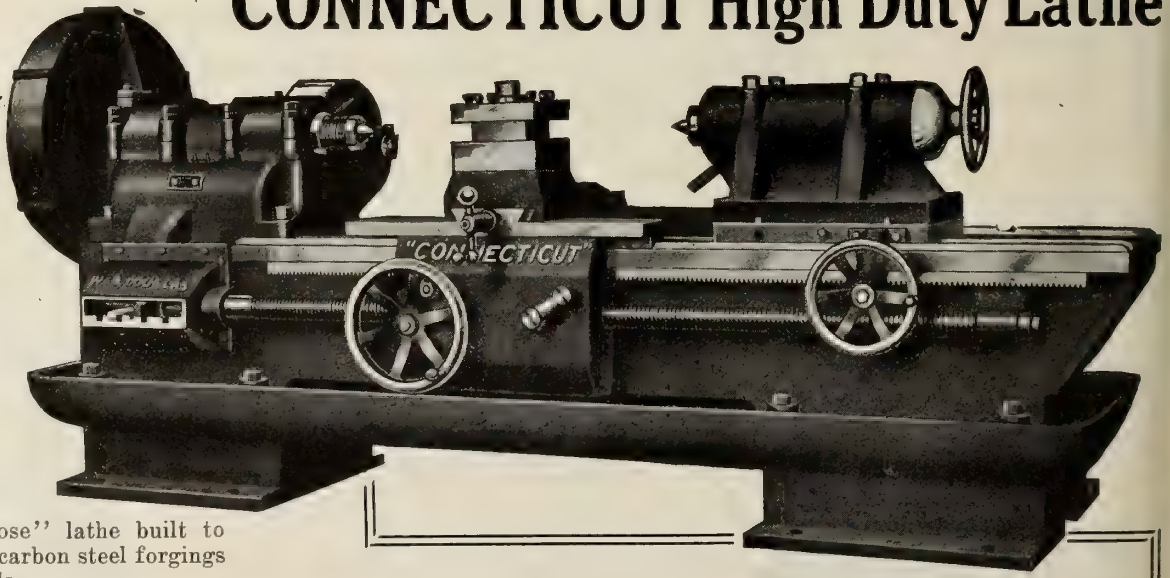
Cisco Lathes sold in Canada by Williams **Makers of Engine Lathes 14", 16," 18", 24"**

CONNECTICUT High Duty Lathe



Sets the pace on HEAVY WORK

A "Single Purpose" lathe built to turn or bore high carbon steel forgings at maximum speeds.

It is in all respects heavier and more rigid than standard 30-inch or even 36-inch lathes giving the same distance between centers.

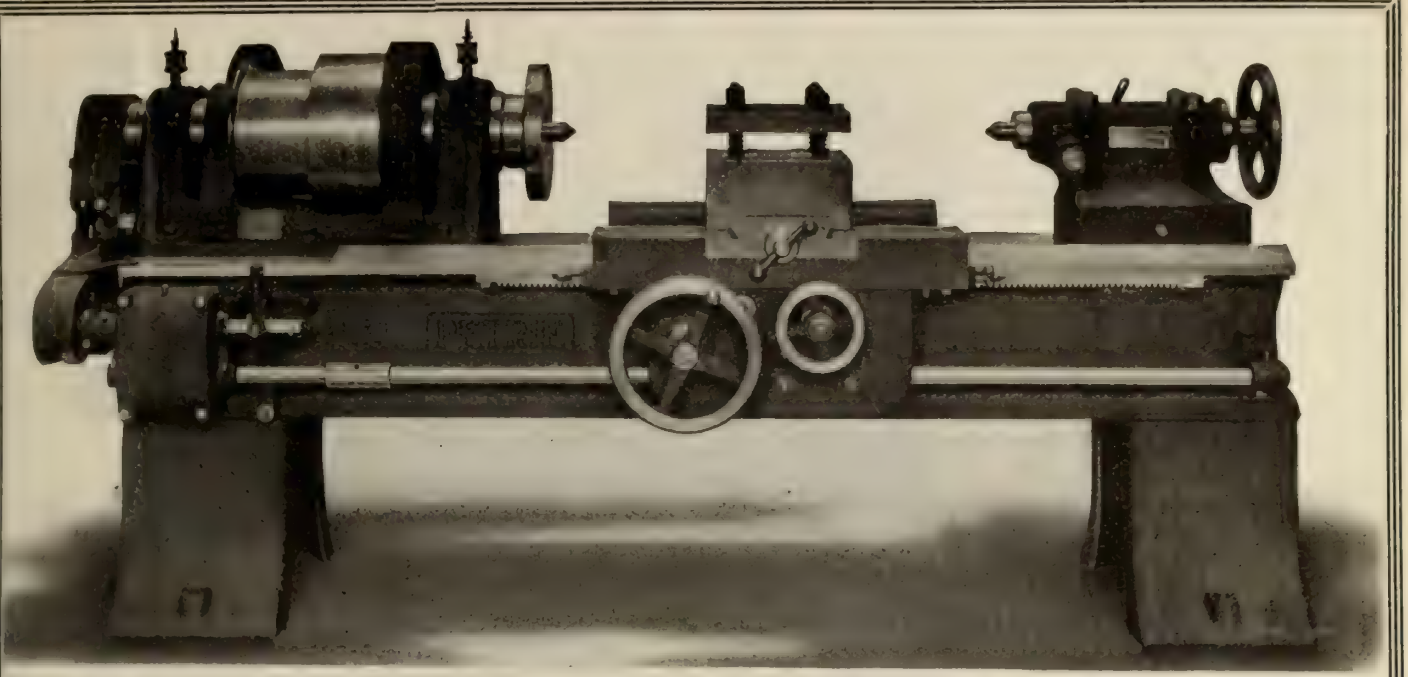
The usual cutting speeds on shell work are 40 to 50 feet per minute on shells up to 8" diameter, 30 feet per minute on larger sizes. Depth of cut from ¼" to ⅝", depending upon the eccentricity of the piece. Our lathes will stand more than this.

We admit the **Big Gear** is not particularly handsome, but it eliminates the train of small gears, and adds greatly to the strength and wearing qualities.

Write for bulletin giving full details.

W. & B. DOUGLAS, ***Middletown, Conn.***

Mention this paper when writing advertisers. It will identify the proposition about which you require information.



Petrie 20-inch Heavy Duty Manufacturing Lathe

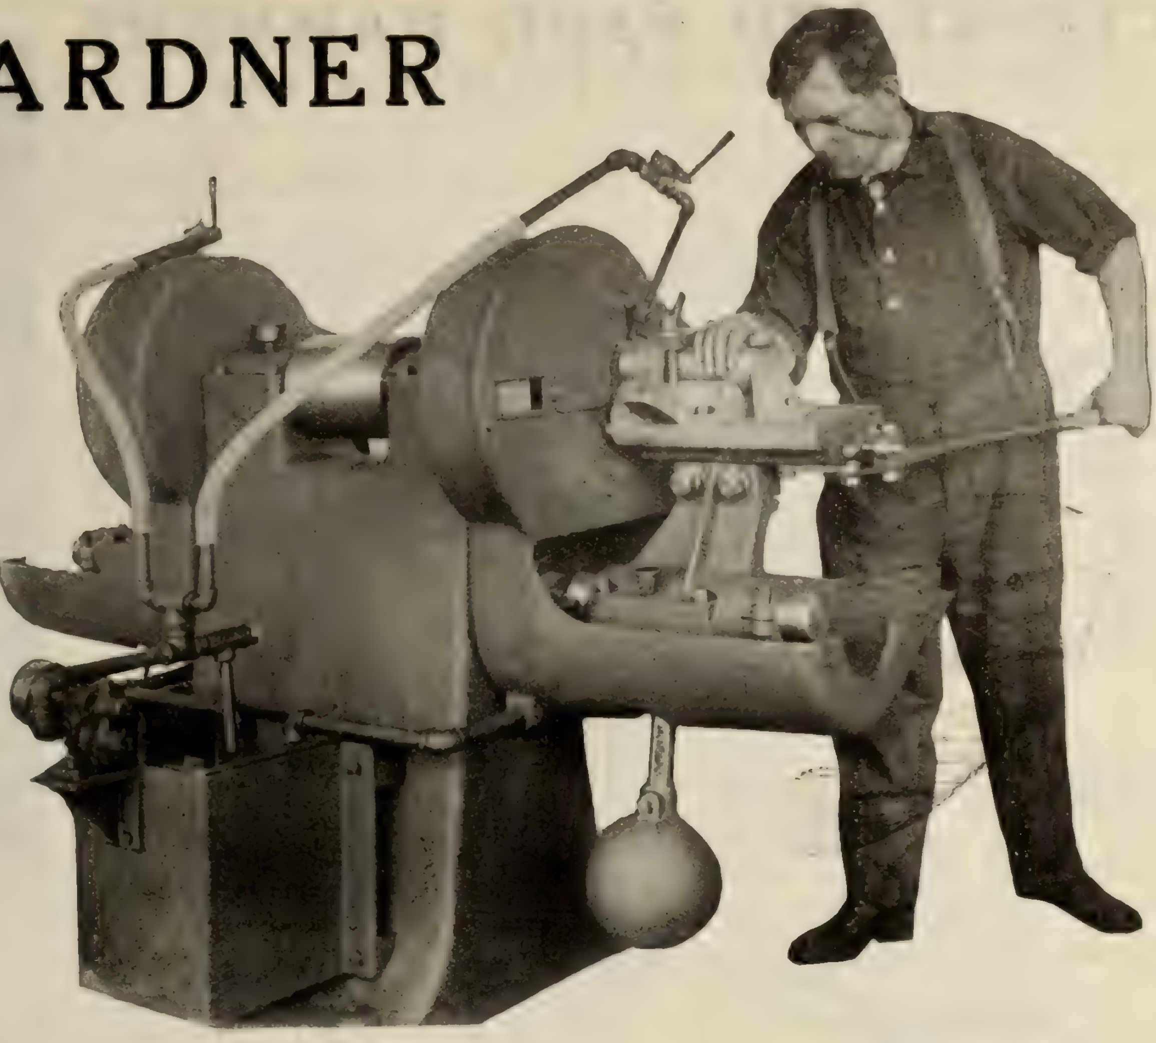
GARDNER GRINDERS



For Grinding Ends of Shells

We have developed a Special Grinding Machine for removing the hub or centre projection from the ends of shells. This grinder is also used for cutting off the square or angular hubs from High Explosive Shell Base Plates.

We build as well a much heavier and more Powerful Grinder to be used for these same operations on 6" Shells.

FEATURES

- High-Grade Babbitt Bearings and Lever Feed.
- Rapid clamping of Shell into "V" fixture.
- Pump and water system driven from countershaft directs the water or grinding compound at point of grinding contact.
- Can be equipped and operated at both ends for double output.
- Output, according to size of projection to be removed, from 40 to 100 per hour.
- Equipment includes two 16" Perfection chucks, two 16" abrasive ring wheels, two semi-universal lever feed work tables, two shell-holding fixtures, water and pump, with connections; countershaft and usual attachments.
- Weight, 4,500 lbs.

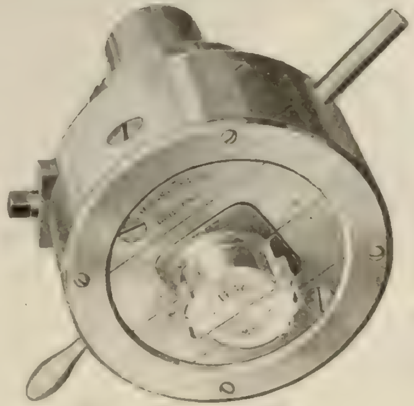
Modern Self-Opening Adjustable Die Heads and Collapsible Taps

Modern Self-Opening Die Head.

"Modern," Self-Opening Die Heads and Collapsible Taps in your thread-cutting department mean efficiency and accuracy. With "Modern" Dies and Taps it is not necessary to take a roughing cut—a single cut gives a finished thread of absolute accuracy in diameter, form, lead and pitch. They are properly supported to insure the cutting of a perfectly straight thread of full size and accurate lead, and will not clog with chips, necessitating frequent cleaning. Cuts close to a shoulder.



Modern Collapsible Tap.

"Modern" Die Heads and Collapsible Taps are used on all styles of Hand and Automatic Screw Machines, Turret Lathes, Chucking Machines, Drill Presses, in fact on any Machine that is used for thread-cutting.

Magic Chuck Equipment

The simplest, safest, easiest to operate and most adaptable chuck on the market. For use on Drill Press, Lathe, Screw Machines and other Revolving Spindle Machines.

"Yes Sir, That Grinder Makes 30,000 R.P.M"

THE Big Chief was skeptical until he saw the DUMORE Grinder at work, then he was convinced that 30,000 R.P.M. was not a dream, but a fact.

He watched one of the

DUMORE PORTABLE ELECTRIC GRINDERS

at work for a moment and asked: "Direct or alternating?" "Both," replied the superintendent, "it has a universal motor."

"And it is dynamically balanced. That means durability and accurate work. It's a world beater," he continued. "Our men find a dozen uses for the DUMORE every day. It weighs only 17 pounds and they carry it from one job to another. It grinds cutters right on the miller—no need to tear down and set up again—some time-saver.

"Yes, sir, the DUMORE does all kinds of grinding; longitudinal, cylindrical, external and internal. It saves so much time—and you know what time means to us, particularly just now. I don't know how we ever got along without it."

That's what you will say, too, when you have put a DUMORE on the job. Let us ship you one on approval—try it on **your own** work. Order now—quick deliveries.

Wisconsin Electric Co., 1704 Dumore Bldg., **Racine, Wis., U.S.A.**

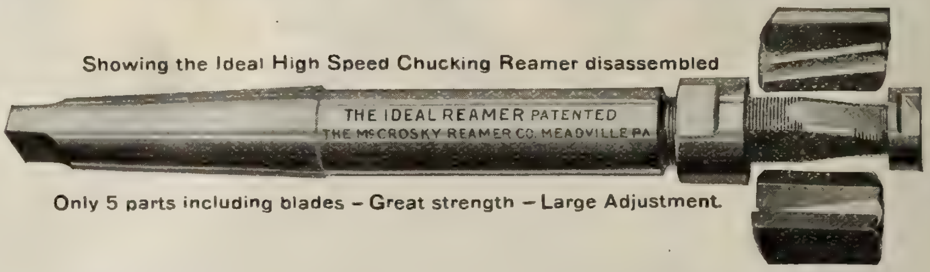
Toronto Office: R. E. T. PRINGLE, LIMITED, 95 King St. East, Toronto.
Complete stock carried by Aikenhead Hardware Company, 17 Temperance Street, Toronto

The Toughest, Hardest and Most Fibrous Metals
ARE REAMED WITH EASE WITH
THE "IDEAL" ADJUSTABLE REAMER

Every hole is reamed true, smooth, and round. There is no binding, heating up nor clogging with chips. It is without equal in most classes of machine reaming.

We recommend **THE IDEAL** for any job in phosphor bronze, steel tubing, steel castings, steel forgings, aluminum or any job you may have where other reamers have failed.

Showing the Ideal High Speed Chucking Reamer disassembled



THE IDEAL REAMER PATENTED
THE McCROSKY REAMER CO. MEADVILLE PA

Only 5 parts including blades – Great strength – Large Adjustment.

A 2" **IDEAL** Reamer will adjust 3/32" and other sizes in proportion. Thus one Ideal will outwear a dozen or more solid reamers, and then it is only necessary to buy a new set of blades.

THE IDEAL is radically different in design from all other types of adjustable reamers. Two solid blocks of High Speed Steel held on an arbor by two powerful collars—nothing more. No screws or small parts. There are four left-hand spiral cutting edges, and every tooth is milled in the solid head—no inserted teeth. Greater simplicity and strength is impossible in an adjustable reamer.

Adjustment is effected by loosening rear collar and tightening front collar, which forces the two halves of the reamer head up the inclined surfaces of the arbor. No shimming under the blades.

Assembled

THE IDEAL REAMER PATENTED

16 in. Lever
POST DRILL

A Giant Little Machine For Light Drilling.

Will drill up to 7/8 inch.

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

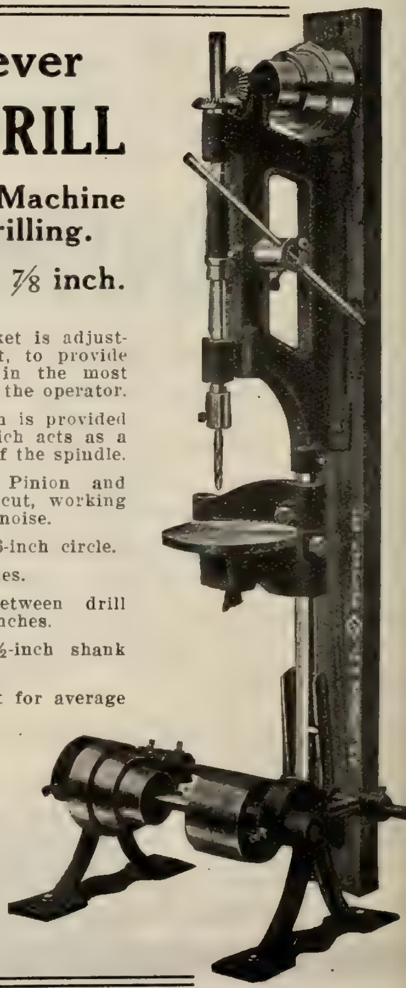
Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 22 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.



A. B. Jardine & Co.
Hespeler, Ontario

One Paragraph From A Machinery Dealer's Letter:-

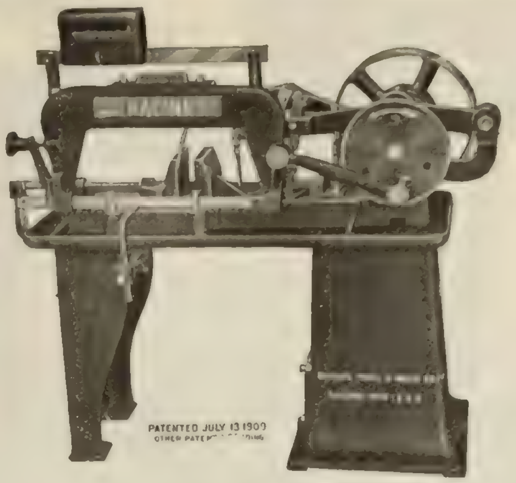
PEERLESS
PEERLESS MACHINE CO. RACINE, WIS. U.S.A.

"One of our customers has recently purchased from us two of your 6" PEERLESS High Speed Power Hack Saws and they now wish to install several more, providing we can take some of their old hack saws in exchange. They claim these old machines are as good as new, but they consider the PEERLESS so far superior to the others that they would like to fully equip their factory with PEERLESS Machines."

The principle of construction in the PEERLESS High Speed Heavy Duty Cutting-off Machine admits of a cutting speed which cannot be approached by the ordinary type of machine. The output of the machine is controlled by the efficiency of the blade. At the maximum speed at which this machine is guaranteed to operate it cuts off a 3 in. round, cold rolled bar in 1½ minutes.

Bearings are extra large. The ones that are subject to excessive wear are made of tool steel, hardened and ground, which eliminates the continuous [illegible] and repairing that ordinarily is the case when a machine is worked to its utmost.

PEERLESS MACHINE COMPANY
1607 Racine Street **RACINE, WISCONSIN**



No. 1—Eats Steel

WHY IS IT

That so many Canadian shops are now equipped and being equipped with

The Newly Improved Racine High Speed, Metal-Cutting Machine?

FOR MANY GOOD REASONS among others because for speed, accuracy, economy and ease of operation THE RACINE cannot be surpassed. You MAY NEED ONE NOW. We will send a RACINE on any trial basis that is fair. WRITE US or any good Canadian dealer.

Racine Tool & Machine Company
15 Melbourne Ave., Racine, Wisconsin, U.S.A.

Cut Your Shop Costs

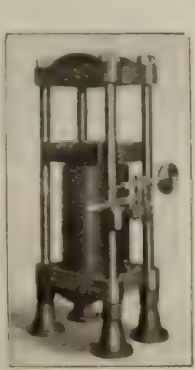
Nobody would think of putting 16-inch lathe work on a 30-inch lathe, then why leave small parts on a large Milling Machine?

A Steptoe Hand Miller or small power feed can be handled quickly and will cut your production cost. You will have less money invested in your Milling Machines and have more machines to do the work.

That same principle applied to your small planer work will cut the cost of planer work.

A Steptoe Shaper will do the work faster because it can be handled quicker.

The John Steptoe Company, **CUMMINSVILLE, CINCINNATI, OHIO, U.S.A.**



Elmes Hydraulic Press No. 676

With ¾-in. Automatic Lever Operating Valve No. 677-A

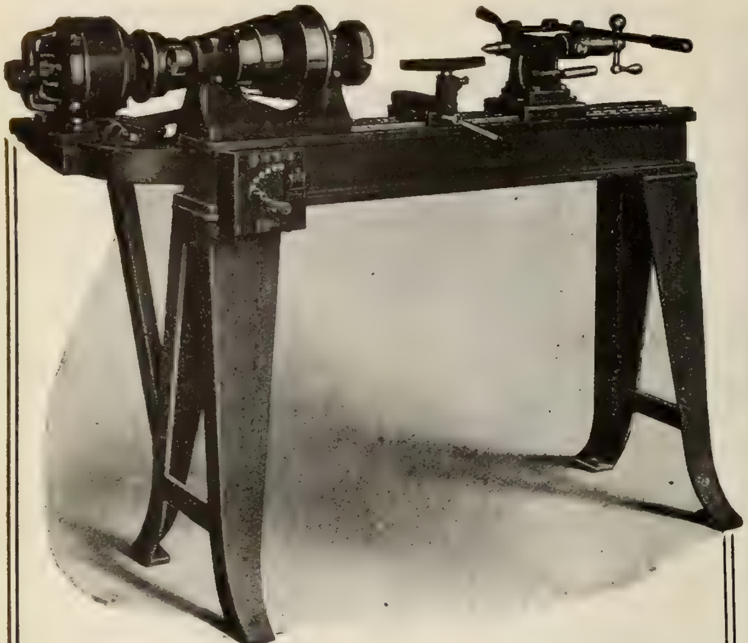
This press is of steel and semi-steel construction, and the stands which support the press are threaded at the ends to receive the steel columns and have holes for fastening to the floor. The platen is guided by the columns.

The operating valve is attached to the cylinder, and is designed with a weight to be set for the pressure desired and releases automatically. To start the ram up, the lever is pushed down; upon the ram reaching the desired pressure, the lever automatically releases (acting as a safety valve as well), causing the ram to descend. Valve body is made of bronze, and other parts are made of tool steel and machine steel. If desired a hydraulic gauge can be attached to show the various pressures, although with this valve it is not necessary.

Write for our Hydraulic Machinery Catalogue.

Charles F. Elmes Engineering Works **217 N. Morgan St. Chicago, U.S.A.**

Over 50 years' experience building hydraulic machinery.

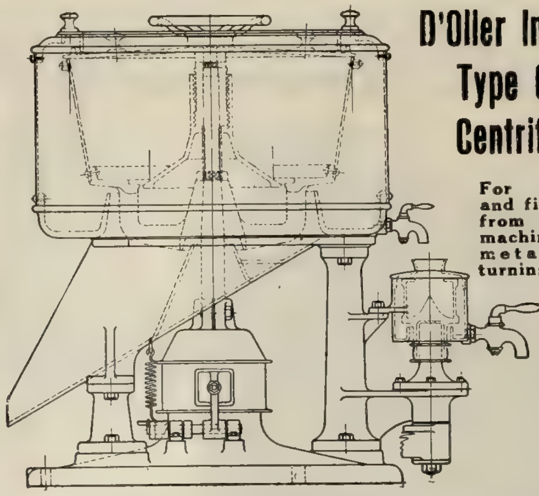


Motor Driven Speed Lathe

This style of motor drive employs a constant speed motor mounted on a plate having an extension arm to support a bearing for the outer end of the motor shaft. The motor plate is fitted to a slide on a shelf which is securely fastened to the back of the lathe bed. The motor plate is moved by means of a screw which tightens or loosens the belt. A four-step cone pulley on the motor shaft is belted to a four-step cone pulley on the spindle. This gives the same speed variation as when a countershaft is used, and by means of various size cones on the motor a wide range of speeds are obtainable.

The lathe spindle is made from high carbon steel, ground to size, and running in self-oiling bronze bearings. The tailstock has screw and lever feed. The bed is crossed-braced and all clamping levers are above the ways.

J. G. BLOUNT CO. - Everett, Mass., U.S.A.



D'Oller Improved Type Chip Centrifugal

For recovering and filtering oil from automatic machined parts, metal chips, turnings. scrap, etc

A large capacity, extremely efficient machine, especially designed and built to care for the "rush" character of work and the increasing volume of shop output now prevailing.

SPECIAL FEATURES

Weston type, self-balancing basket, 30 in. diameter, motor driven.

Bottom chute discharge and conical unloading valve.

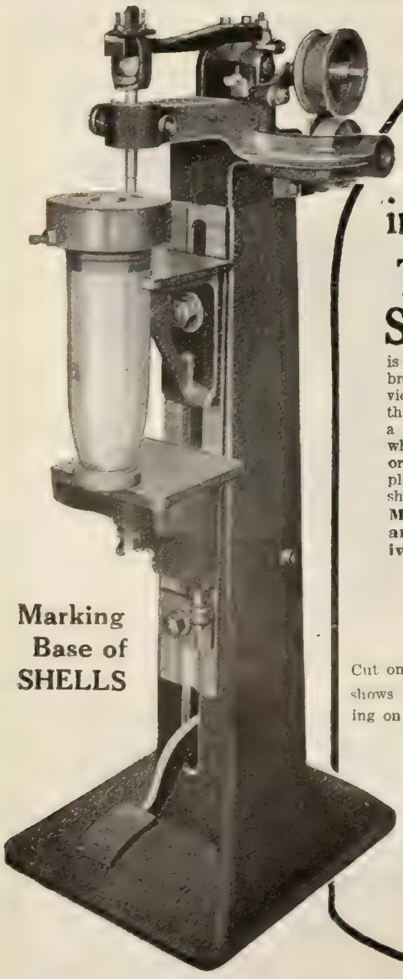
Centrifugal oil filter attachment.

The 30" Weston type self-balancing basket, which is the largest capacity for this service, is of the non-removable type. No service (removable) baskets are required for this machine, the load being dumped into the operating basket and discharged by means of our special conical unloading valve and chute, which is a great time-saving feature.

The centrifugal oil filter, with which the machine is equipped, is operated by the main driving belt, the complete unit being therefore self-contained, simultaneously recovering and filtering the oil from the chips, turnings, etc.

D'Olier Centrifugal Pump and Machine Co.

Morris Building, Philadelphia, U.S.A.



Marking Base of SHELLS

A PERFECT JOB in 15 Seconds

The "Grant" Shell Marker

is so arranged that the blow is brought to bear on each individual letter successively, while the blow can be adjusted to give a shallow or deep impression which is uniform for each letter or figure. The work is completed in one revolution of the shell, which is done by hand. **Made for 18 pdr., 4.5 in., and 60 pdr. high explosive shells.**

The New "Murchey" Adjustable TAP

MURCHEY MCH. & TOOL CO
DETROIT, MICH.
2"-14
WHITWORTH

POSITIVELY ACCURATE

10 times the life of the ordinary tap

With the Murchey Tap and chasers can be ground any number of times and adjusted each time to compensate for wear. **One set of chasers will last ten times as long as a solid tap,** and new chasers can be replaced at low cost.

Now with the solid tap it is an entirely different matter. Just as soon as you begin to sharpen a solid tap, it loses size and accuracy, and after one or two sharpenings the tool is of no further use.

This new Murchey Adjustable Tap is working finely and we are receiving a great number of orders for it. Send in yours to-day—the price is of no consequence considering the remarkable results and economies shown in length of service.

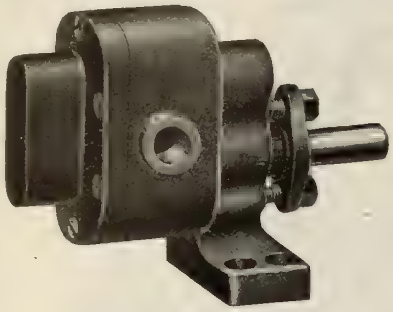
Positive in Action Simple in Construction



Type 1 One-way

Type 2 One-way

ROPER

Circulating OIL PUMPS

Give a steady, non-pulsating stream delivered in proportion to the speed of the machine.

Type 1 One-way pump is especially designed for use on machines in which the cutting tools operate constantly in one direction, although by belting separately to the pump it may be used on a reversing machine.

In this form of pump a separate relief valve is used in the pipe line if it is desired to close the delivery pipe while the pump is running, or if the delivery is varied in quantity.

Where it is known that the delivery will be cut off or varied at times with the pump running, our **Type 2 One-way pump** provides the best as well as the cheapest way of accomplishing this result.

By using this form of pump, the piping is much simplified and the cost of installing is less while the appearance of the pump on the machine is much better.

It will pay you to investigate Roper oil pumps—they are saving money everywhere.

Promote Friction at the Bench

Not mental—physical friction. Do not ask a workman to turn out a good job with a poor file.

When a file reaches its "inefficient point" it reduces physical friction but creates mental friction.

A man working with a poor file knows that he is not doing his best, knows that he is taking twice, or three times, as long to do the job and will surely be irritated if he is called to account for the result.

It is cheaper to supply a new file than it is to have a workman irritated for half an hour using an old one.

Have your factory superintendent and shop foreman see that their men turn in their files for new ones the moment they reach their "inefficient point."

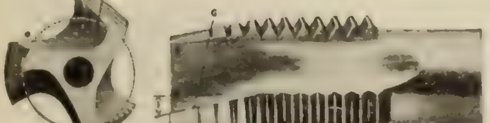
Introducing The "GUN" TAP



"It Shears"

WHY IT IS CALLED "THE SHEAR CUTTING TAP."

The cutting edges at the point are ground at an angle to the axis (see illustration, F). This enables the Tap to cut with a shearing action and the angle deflects the chips, so that they curl out and **ahead** of the Tap and do not break up and collect in the flutes.

EASE OF CUTTING.

Note the hook on the cutting edge (G). This, combined with the shear cutting action, makes the "Gun" Tap the easiest cutting Tap on the market.

On especially tough jobs through layers of material of varying hardness it cuts hole after hole with perfect ease.

STRENGTH.

The flutes of the "Gun" Tap are less in number and shallower then those of the ordinary Tap therefore, in itself is almost as strong as solid stock. Couple with this its easy-cutting qualities and you have a Tap that practically never breaks.

PRODUCTION.

In number of holes tapped in a given time the "Gun" Tap excels, not only because of the easy cutting qualities and strength already described, but because there is no lost time due to removing broken Taps or frequently backing out the Tap from deep holes to clean collected chips from the flutes.

There will be a tremendous saving in your tapping costs if you let the "Gun" Tap do your work.

Send to-day for the illustrated bulletin which goes into details regarding this remarkable Tap.

CANADA'S DEPARTMENTAL HOUSE FOR MECHANICAL GOODS

Mechanical Applications of Oxy-Acetylene Welding Apparatus

Staff Article

In few fields of industrial effort have the applications of scientific research had so much influence on the welfare of mankind as in the utilization of high temperatures. Methods of obtaining, controlling and applying intense heat are in a state of constant evolution, and in variety of applications, economies effected, and future possibilites as a heat generator oxy-acetylene gas already occupies an important position in the industrial world.

FEW industrial processes have undergone such rapid and extensive development, or become so indissolubly linked to existing industries by virtue of their merits as the use of oxy-acetylene gas in connection with iron, steel, and metal manufacture. In the short space of ten years the applications of this process have increased enormously, and with the development of new apparatus and the improvement of methods as indicated by experience, the results to be obtained in many lines of manufacture are such that a forced return to pre-oxy-acetylene days would be little short of an industrial calamity.

The rapidity with which scientific inventions are adapted to the requirements of industry is well indicated by the work of the Davis-Bournonville Co., which in 1906 began to develop the patent rights for the independent positive-pressure type of welding torch, the basic principles of which have been amply justified during the past decade. During the early years of development much of the work was confined to repair and reclamation, but although originally more or less of a salvage process, the application of oxy-acetylene welding and cutting to straight manufacturing operations soon began to receive attention until as the result of proven merit, it occupies a recognized place in the equipment of certain industries.

Five distinct types of machines have been envolved by the firm referred to, special apparatus to meet particular requirements being produced when necessary. The machines include the Oxygraph illustrated in Fig. 1. This apparatus consists of a pantograph frame on the tracing end of which is mounted a tracing roller propelled by a small electric motor. Mounted on the frame is a special cutting torch, which can thus be moved over the surface of the work as desired and any shape, regular or irregular can be cut out of the metal, the cut being started and stopped at any desired point without cutting through the side of the work. The frame cuts very rapidly, an average travel of 12 in. per min., being easily maintained. As shown in the illustration, the self propelled tracing wheel is guided along the outline of any desired shape so that exact duplicates can be produced at any time the amount of reduction between the drawing and the work being one-half.

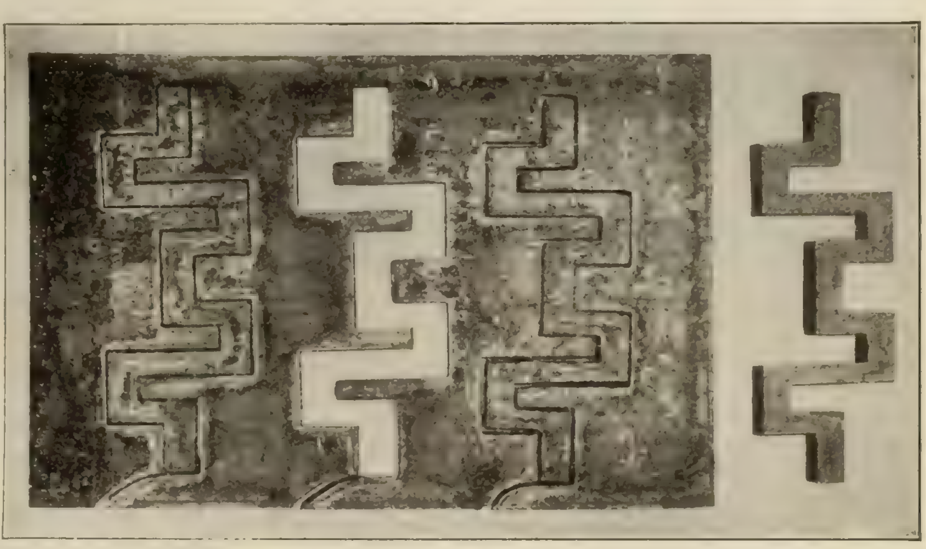

FIG. 2. CRANKSHAFT BLANKS CUT FROM THE COLD SLAB BY THE OXYGRAPH APPARATUS.

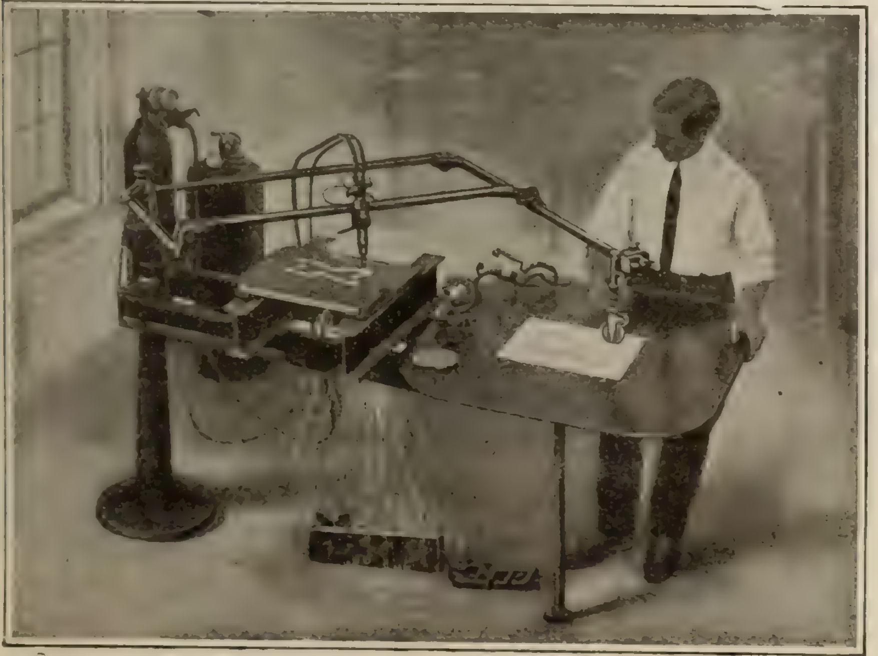

FIG. 1. CUTTING OUT BLANKING DIES WITH THE OXYGRAPH APPARATUS.

That such a machine has valuable manufacturing applications can be seen from Fig. 2, where crank shafts in the rough are cut from the solid rolled slab. Such cutting, however, is not confined to moderate weights of metal as a cutting torch of the type shown has been successfully used in trimming slabs of armor plate to shape, cutting a slice 1 in. thick or more from the end of a block 16 in. deep, at the rate of 1 sq. in. of section cut per minute.

Kindred mechanical devices include the Holograph for cutting holes in the web of rails or in structural iron; the Radiagraph for the purpose of cutting plates or sheets into round oval or irregular forms; the Railagraph, for cutting the rails of steam or electric railways, or all kinds of forms in structural work.

Automatic welding machines have likewise been developed, such as tube welding machines for the welding of commercial steel tube and barrel welding machines which enable comparatively unskilled labor to produce entirely reliable work. The barrel welding machine is illustrated in Figs. 3 and 4, and consists of a work holder and a torch holder, the former consisting of a short column which carries two radial arms on which the barrel bodies are supported in a horizontal position, the arms swinging round in a horizontal plane so that each body is brought into line with the torch frame in turn.

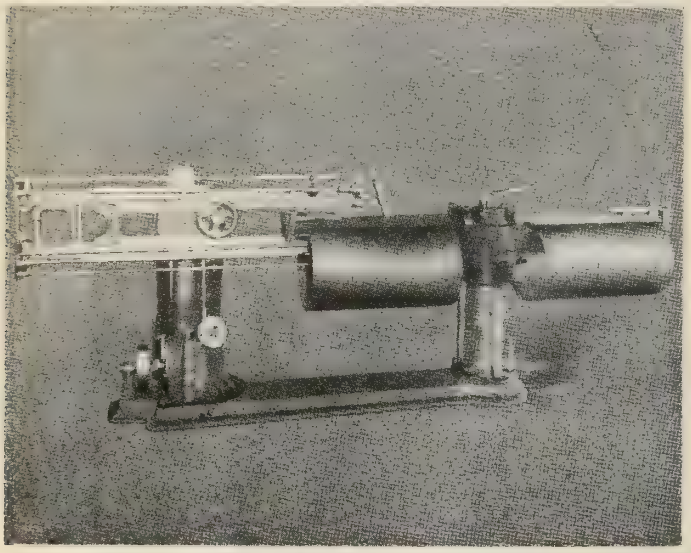

FIG. 3. MACHINE FOR WELDING BARREL BODIES, USING OXY-ACETYLENE FLAME ON BOTH SIDES OF JOINT.

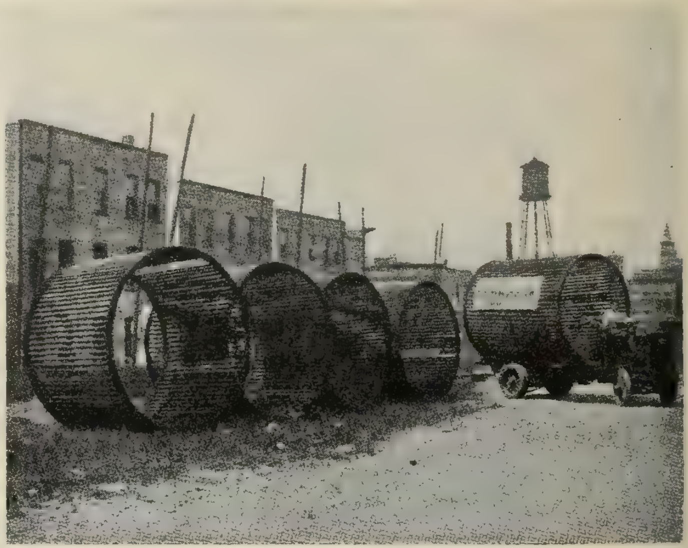

FIG. 6. COMPLETED HEATER UNITS WITH WELDED JOINTS THROUGHOUT.

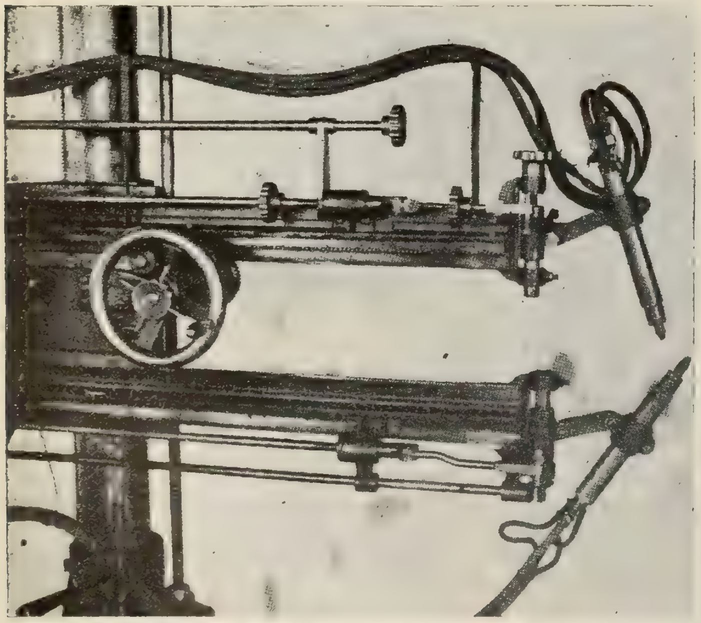

FIG. 4. DETAIL VIEW OF TORCH CARRYING APPARATUS ON BARREL-WELDING MACHINE.

The torch frame, Fig. 4, consists of a U-shaped member supported horizontally and working in slides on the side of a column, so placed that one arm of the frame passes inside the barrel body while the other one is on the outside, the flames from the two torches rapidly bringing the metal to a welding temperature. Variable power feed is provided for the torch frame, changes in speed being necessary to suit a variety of weights of sheet metal. When the body on one arm has been welded, the double arm is swung around a half circle when welding proceeds on the second body, the first body being removed and a fresh one placed in position. In this way continuous operation is assured. A typical barrel body will be a sheet of steel 3-32nd in. thick bent to form a hollow cylinder. The edges are previously prepared by being upsea so that when brought together there will be an excess of metal on both sides. This excess, while slight is necessary to enable the machine to work without the use of welding rods and solves what promised to be a difficult problem. These machines are now in actual use accomplishing efficient welding at a speed of from 12 to 20 in. per minute, using two standard water-cooled torches.

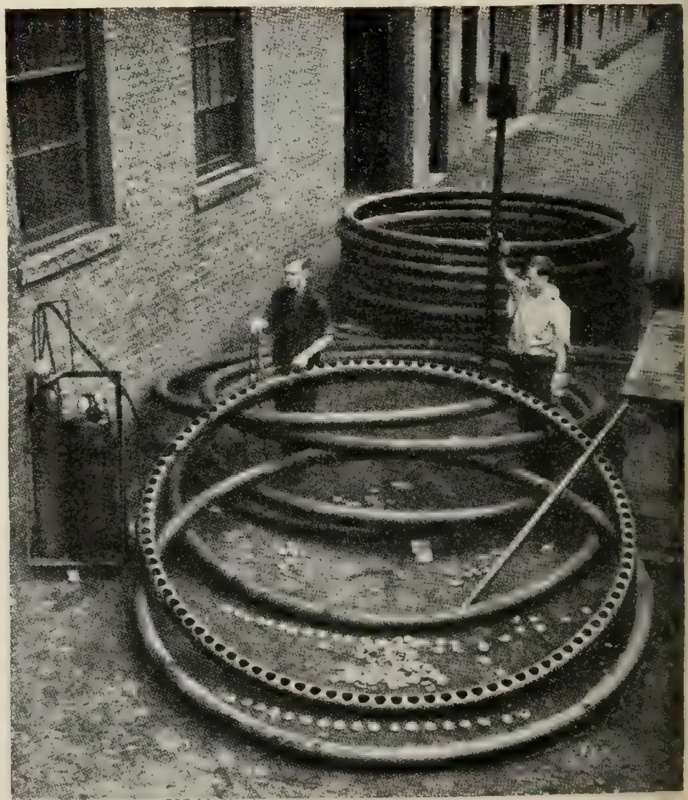

FIG. 5. USING CIRCULAR CUTTING TORCH FOR MAKING TUBE HOLES IN HEADER.

A considerable departure from the ordinary run of welding work is shown in Figs. 5 and 6, the job here shown being large steam heater coils, a number of which were constructed by the company for use in oil refining. These heaters were about 10 ft. in diameter by 7 ft. high, and consisted of a 4-in. heater top and bottom connected by numerous 2-in. tubes. The holes in the 4-in. headers were all cut with an oxy-acetylene circular cutting torch, the total number of holes being 1,488. Fig. 5 shows the cutting of the holes in the headers, and Fig. 6 shows the complete heaters.

The assembling of the heaters was done by suspending the upper head from a crane when the 2-in. pipes were placed in position and several of them tacked to both headers with the welding torch to maintain position and alignment. The welding of the pipes to the bottom header was first completed after which the coil was inverted and the opposite ends of the pipes welded to the other header.

The time and gas consumed were as follows: Cutting time, each 2-in. hole, 1 min.; oxygen for ditto, 1.25 cu. ft.; acetylene for ditto, 2 cu. ft.; welding time, each 2-in. pipe, 10 min.; oxygen for ditto, 6.2 cu. ft.; acetylene for ditto, 5.4 cu. ft. The circular cutting torch used oxygen under 20 pounds pressure and the weighing torch used acetylene under 6 pounds and oxygen under 14 pounds pressure per sq. in.

FOUNDRYMEN'S CONVENTION AND EXHIBITION

CONCURRENT with the Annual Meeting of the American Foundrymen's Association and its affiliated Exhibition at Cleveland, Ohio, from September 11 to 15, the American Institute of Metals will hold its annual sessions at the same time and place. The following tentative business programme has been arranged by the latter:—

"Reclamation of Metallics from the By-products of Foundry and Manufacturing Plants," by A. F. Taggart, Hammond Laboratory, Yale University, New Haven, Conn.

"Method of Selling Non-ferrous Scrap, as Pursued by a Large Producer," by J. M. Bateman, Western Electric Co., Cleveland, Ohio.

"The Results of Joint Work of Casting and Testing the 88-10-2 Alloy by Five Foundries. Report of the Use of the Deoxidizers of Bronzes, and eRport on the Aspects of Bronze Failures," by various experts affiliated with the U.S. Bureau of Standards, Washington, D.C.

"Copper-Aluminum-Iron Alloys." By W. M. Corse, Tatanium Alloy Mfg. Co., Co., Niagara Falls, N.Y.

"Tests on Rolled Brass Sheets Taken in the Direction of Rolling and at Right Angles to These Directions." By W. B. Price and P. H. Davidson, Scovill Mfg. Co., Waterbury, Conn.

"The Application of Oxy-Acetylene Welding Process in the Repair of Defective Non-Ferrous Castings." By S. W. Miller, Rochester Welding Co., Rochester, N.Y.

"Continuation of Discussion in Connection With Defective Bronze Castings In Use By the Board of Water Supply of New York City." By A. D. Flinn, Board of Water Supply, New York City.

"Evolution of Die Casting Process." By Chas. Pack, Doehler Die Casting Co., Brooklyn, N.Y.

"Disclosure of Blow Holes by Means of X-Ray Apparatus." To be reported by testing engineers employed in laboratory D of the General Electric Co., Schenectady, N.Y.

"Aluminum Castings and Forgings." By P. E. McKinney, U.S. Navy Yard, Washington, D.C.

"Annealing Properties of Copper." By G. W. Ceasor and G. C. Corner, Hammond Laboratory, Yale University, New Haven, Ct.

"Metallography as Applied to Non-Ferrous Metals." By W. W. Arthur, Frankford Arsenal, Frankford, Philadelphia.

"Heat Treatment of German Silver." By. C. C. Holder, American Optical Co.

S. D. Sleeth of the Westinghouse Air Brake Co., Wilmerdene, Pa., and Mr. Barnes of the Fort Wayne Electric Co., Ft. Wayne, Ind., will present papers at the session to be devoted exclusively to the discussion of brass foundry practice and papers also will be read by F. L. Antisell, Rariton Copper Works, Perth Amboy, N.J., and by Mr. Bragg, Ohio Brass Co., Mansfield, O.

Entertainment Features

These will consist of a trip to the ball park, Tuesday afternoon Sept. 12, to witness the game between Cleveland and Detroit; a trip to Euclid Beach Park, Tuesday evening, Sept. 12 in special cars where tickets to all concessions will be furnished; an inspection tour to the Cleveland Furnace Co. plant, Wednesday afternoon, Sept. 13, and a theatre party at Keith's Hippodrome, the evening of Wednesday, September 13. The ladies will be tendered a luncheon at the Hotel Statler, and also will be given an automobile ride. The annual banquet will be held Thursday evening at the Hotel Statler, and Irving Bacheller, the noted humorist, will be one of the speakers. Plant visitation will be limited to Thursday and Friday, Sept. 14, and 15, arrangements having been made for the inspection of the plants of the Ferro Machine & Foundry Co., the Allyne-Ryan Foundry Co., and the Westinghouse Electric & Mfg. Co.

PLACE AND PURPOSE OF INSPECTION DEPARTMENT

IN the majority of factories, says F. B. Corey, in the Dodge Idea, the inspection department is under the authority of the factory manager or superintendent, in other words, that branch of the organization which builds the apparatus, and decides whether that apparatus is properly built. It is unnecessary to point out the inherent weakness of this arrangement.

Liability to Biased Judgment

The judgment of the inspector may continually be biased by the fact that he is a part of factory orginazation and is responsible to the factory management. It is, therefore, evident that the highest standards of quality and workmanship can hardly be maintained continuously if the members of the inspection department are in any degree subject to the control of a factory superintendent or any other executive who is directly responsible for the factory production and has no connection with the engineering or sales organizations. This statement should not be understood as expressing a doubt in regard to the loyalty or honesty of purpose of any factory official. We must recognize the fact, however, that defects, due to drawings or specifications, are often disregarded by inspectors if they know that no criticism can be attached to them by their superiors on account of the latter's approval of the apparatus, especially when a rejection would prevent meeting a promised date of delivery.

In a smaller number of shops, the inspection department is under the control of the chief engineer. With this arrangement, the judgment of the inspector is likely to be biased by the fact that any defects in the finished product, due to improper specification of materials or any failure of the apparatus to function properly, might be considered as reflecting on the abilities of the engineering department. The inspector will often hesitate to reject a device if he thinks that the objectionable feature may be attributable to his superior officer, as it would imply a difference of opinion that might reflect discredit on the inspector's judgment. Moreover, there is often a tendency among young and subordinate engineers to refuse to recognize slight defects in a design for which they are personally responsible, and to severely criticize an inspector who points out what he considers a defect in such apparatus. Therefore, it will be seen that in most cases the executive head of the inspection department should be as free from control of the engineering department as from the manufacturing department.

Inspection Head Responsibility

The only logical plan of organization is that in which the head of the inspection department, whatever may be his title, is responsible directly to the general manager of the company or the chief executive in control of the factory output. He should report to the same officer as the works manager or the chief engineer. At the same time, he must be in full sympathy with all other departments. He must command the respect of the other department heads and be ready to co-operate with them to further the interests of his company.

The executive head should exercise a most thorough control over all the activities of the department. To that end, there should be no recognized paths of communication betwen this department and the heads of the other departments, except through his office. The strict enforcement of this rule is essential to the efficient working of the department and to the avoidance of misunderstandings and duplication of effort. This requirement, if rightly understood, will not be interpreted as limiting the useful activity of any member of the department, but will be recognized as a necessary feature in the conduct of inter-department business.

Chief Inspector's Qualifications

The executive head of the inspection department should be thoroughly familiar with general engineering practice and standards. He should be well informed on all shop methods, including foundry and machine shop practice, and be thoroughly versed in the use of testing machines and gauges. He should, if possible, be conversant with chemical laboratory methods and apparatus, so as to be able to direct intelligently that part of his organization. Moreover, he should be familiar with the uses of the factory product and the conditions under which it is to operate after it has passed beyond the control of the factory. He must have absolute control of every inspector in the plant, and be held responsible for the quality of material and workmanship of all that the plant produces.

Customers' Complaints

In the majority of manufacturing corporations, all dealings with the customers are conducted by the sales department exclusively, which is the logical arrangement. For this reason, complaints on the part of the customer are made directly to the sales department and usually reach the shop through a more or less tortuous channel. There is sometimes a tendency on the part of the sales department to assume that all of these complaints are justified, to criticize the shop for turning out an unsatisfactory product, and especially to blame the inspection department for failure to prevent the issuance of the material in question.

In justice to all concerned, including the sales department, all such complaints should be referred to the executive head of the inspection department for a personal investigation and report, and action on the part of the sales department, except so far as it relates to the replacement of material urgently needed, should be deferred until the report is in hand. This report may entirely change the attitude of the customer with relation to the alleged defective material, as it may clearly show that its failure to meet his expectations was due to no fault of the manufacturer or of the apparatus involved.

The trouble may have been due to injury in shipment, rough handling after receipt, failure to install or to apply it properly, lack of proper maintenance on the part of the customer or his employees, or to a misconception of the capacity or function of the apparatus itself. Any errors on the part of the factory or inspection department must be freely acknowledged and any steps to prevent their recurrence should be fully explained. An unbiased report, based on all the available facts, rendered by the head of the inspection department to the head of the sales department, may be invaluable to the salesman in his negotiations with the customer.

The inspection department exists for the mutual protection of the manufacturer and the customer. The salesman should be informed in regard to the methods and practice of the inspection department, as this knowledge may be of great service in promoting friendly relations with a prospective or actual customer. The customer is often much interested in the means employed to ensure accuracy in the manufacture of the apparatus he proposes to use. The head of the inspection department should, therefore, make it his duty to advise the sales department of any change in procedure or equipment that might be of interest to that department in its dealings.

The relations of the inspection department to the engineering department are most important, especially in the influence that may be exerted on the designs for new apparatus and the improvement of the old. In many places, new drawings, when completed and before their final approval, are submitted to a committee (variously known as "mechanical design committee," "limit committee," "standard committee," etc.), to determine if the limits set by the designers are such as can be met commercially in the factory, and to decide if any changes are desirable on account of methods to be used in the foundry, machine shop or elsewhere.

The head of the inspection department should be one of the most important members of this committee; in some instances he is chairman. His principal duty in connection with this committee is to advise if the dimensions, tolerances and limits called for on the drawings are satisfactory for the various fits, and if the quality of finish called for will be satisfactory to the inspection department. Thus the work of the inspection department should begin even before the designs are approved for manufacture.

Inspection Department Organization

The internal organization of the inspection department and the means and methods best adapted to carry out the details of its work are matters that will depend to a great extent on the management and operation of the larger manufacturing organization of which it forms a part. A plan of organization that may be highly efficient in one factory may be deficient in meeting the needs of another shop producing a different product or producing a similar product by widely different methods. The organization of inspectors that is perfectly suited to a factory having a large output of a few well standardized articles would be wholly unable to cope with the situation arising in a smaller factory producing a great variety of articles, but making each in comparatively small number. It is obviously absurd to try to apply big-shop methods to a small shop, and the converse application, while far more usual, is no more logical. Such matters must, therefore, be subjects of careful investigation and study in each individual plant.

CONTRACTION CAVITIES IN SPUR WHEEL BLANKS

THE following query appearing in a British contemporary is of more or less interest to readers of our journal, some of whom may have been up against a like trouble; on the other hand, there may be those who are prepared to suggest a solution.

I am having trouble with certain Government work which is really very simple from a moulding point of view, namely, spur-wheel blanks. The teeth of these are cut, of course, after they are turned and I find in many of them liquid contraction or gas holes at the rim where the arms join. (These are mostly of H section.) To get rid of contraction I introduced "chills," at the corners of the arms, and found that for a while I quite got over the trouble at that point, although it seemed then to move midway between the arms.

The larger wheels (some exceed 1 ton) are moulded in the floor and the arms are cored out in the usual way. The mould is made of dry sand and is dried in the floor; the smaller ones are taken to the oven and dried, cast from the hub, with four risers on the rims. The wheels generally have six arms. A feeding rod is placed in the hub, and also in the risers. The metal we use taps out at:—Carbon, 3.40; silicon, 1.9 to 2.5; sulphur, 0.6; manganese, 0.6 to 0.8; phosphorus, 0.80 to 1.2.

I have tried green sand also, but the percentage of wasters is about the same. I would be pleased to have a suggestion for a solution of the difficulty.

and Ideas Evolved from Actual Practical Application and Experience

FIXTURE FOR SHEARING PINS.

By F. M.

HAVING a large number of pins to cut-off and nothing suitable for doing the job, the fixture shown in the accompanying illustration was devised. It is practically a shearing punch and die in a suitable holder which can readily be adapted for various sizes of wire. This tool consists of the base A drilled out at C and D to allow the wire to pass through; the bushing B is to guide the wire and is of steel hardened to form a die; the long plunger E is the punch, and the die and punch are both flatted at F where they come in contact for shearing.

In operation, the plunger E is struck with a hammer which shears the wire off against the die when the plunger is returned to its original position by spring G. The plunger is prevented from springing out of the hole by screw H. This makes a very rapid method of cutting off pins and does not wear the hands as would a pair of heavy shears.

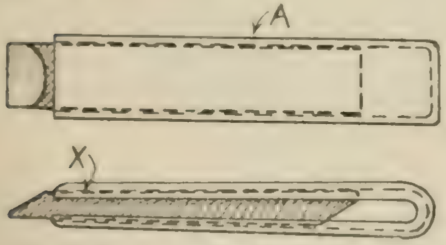
HOLDER WHICH SAVES ERASERS.

By H. Scriber.

A HOLDER which proves very economical in the use of erasers especially for drawing is shown in the accompanying illustration. The idea of this holder is to permit the eraser to be cut in half lengthwise, then taking one half of the eraser, place it in the sheet metal holder A, which is steel, spring tempered, thus binding eraser at X. The holder securely grips the rubber at the end. The eraser being narrower and stiffer than an ordinary rubber without the holder, it permits of more pressure being placed on the eraser, and also allows the user to better see the lines being erased.



HOLDER WHICH SAVES ERASERS.

CHART FOR FINDING WEIGHT OF CAST IRON PIPE.

By N. G. Near.

THE accompanying chart will be found useful for determining the weight of cast iron pipe or cast iron columns. It is not necessary to do any computing at all. For example, what would be the weight of a cast iron pipe 30 ft. long, with a dimension D of 24 inches, and a thickness of one inch? The dotted lines drawn across the chart show how it is done. First connect the 30 (column A) with the 1 (column D) and locate the intersection with column B. From this point of intersection run straight to the 24 (column E) and the result is found in column C. The weight is practically 7,000 pounds.

It will be noted that the range of the chart is very wide and will give the weight of a total length of all ordinary sizes up to 1000 feet. For rough estimating work this chart will be found hard to equal.

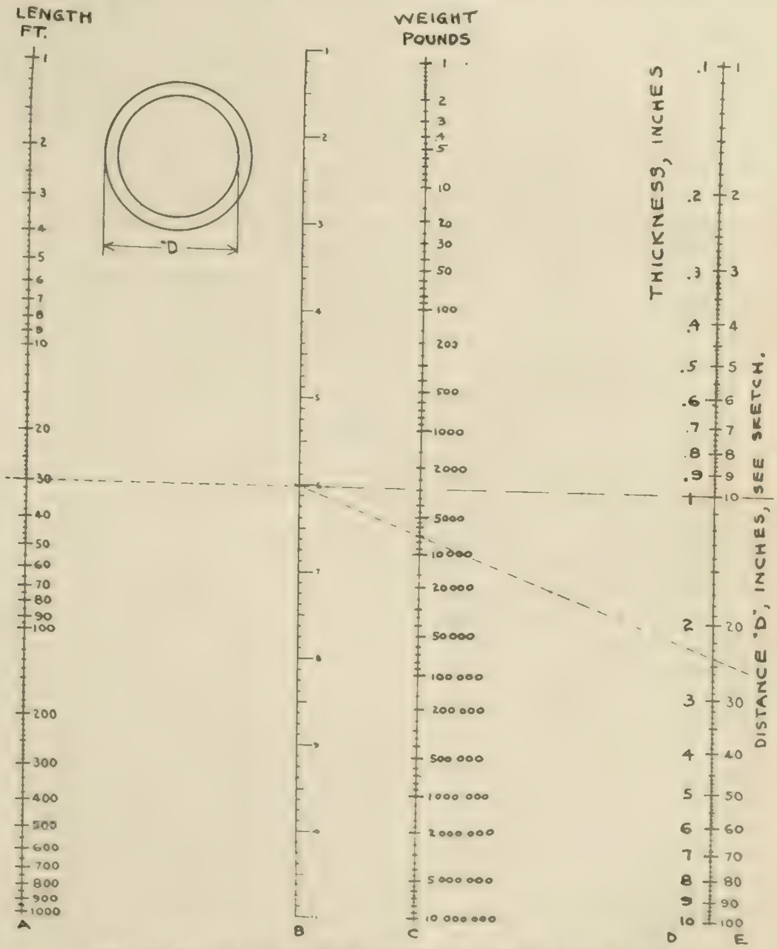

CHART FOR FINDING WEIGHT OF CAST IRON PIPE

MOLDING HAND GRENADES

By Allan Hill.

THE hand grenades which are being used to an enormous extent in the present war are of various types, but are generally round or oval in outline, and are made of various materials. The most destructive have been proved to be those made of cast iron, and molding of which is here described. The weight varies in different designs, but each design must be kept to its given weight, so the best method of molding is by machines, which keeps them to a perfect shape as well as a correct weight, and is more sure than ordinary pattern-plate molding on the floor.

Large Outputs at Low Cost.

The making of these grenades involves large outputs at low costs, and, as large numbers of foundries are engaged in their manufacture competition is very keen. The biggest proposition is in obtaining the cores. They are not difficult to make, but if ordinary methods are used a large amount of labour is required, for one molder will use more in a day than one core-maker can make in two days.

The sand must be such as to make a solid core that can be handled without damage, allow free venting, leave a smooth skin on the inside without having to resort to the use of blacking, and also enable the core to be removed from the casting whilst in the tumblers. Oil-sand mixed in the right proportions will be found to be the most satisfactory, as it will fulfil all the conditions mentioned, the following being the mixture used:— 1 barrow of dry rock sand, ¼ barrow of sharp sand, 1 quart of boiled linseed oil. These must be thoroughly mixed. The mixture being given its working degree of dampness by the addition of water. The core-boxes also must be kept well oiled with paraffin, and kept warm; if this is not done the sand will adhere to the box.

Molding Methods Employed.

Various methods of molding have been adopted, each establishment using its available appliances, converting them for the purpose and no doubt following its own practice as far as possible. The following are the methods used in a large Lancashire foundry, where quantities of two types are being turned out, one a round one, the other an oval one which goes by the name of "Mill's" grenade.

For the round grenades two series of machines are used, Farwell hand presses and stripping-plate machines made by the Adaptable Molding Machine Co., on which the molds are hand-rammed. In both cases the patterns are mounted so that cope and drag are rammed from the same face, using one pin and one pinhole in both cope and drag. On the "Farwells" a 12 in. by 12 in. snap flask is used, four castings being made in one flask. No bands are used for casting, a heavy flat weight with an opening for the runner being placed on the top of the mold.

On the "Adaptable" machines, cast-iron boxes are used, with eight castings in one mold, the boxes being 18 in. by 12 in. These are shown in Fig. 2. On the pattern face are thin pieces of wood leading from the centre of the core print to the outside of the mold, being ventways to carry the air and oil gases away. On all molds for this class of grenade, a small vent wire is pushed through the top to conduct the air from the mold, so the castings may be run very quickly, the ingate being placed on the side of the casting. The facing sand used is a mixture of equal parts of best red, yellow brass, and old floor sand, with the addition of 1-20th of the whole bulk of coal dust, the whole being well ground and mixed before using. This does away with dusting the molds with facing, the sand coming away from the castings quite easily and leaving a very smooth skin.

Core Feature.

The cores are shaped like a dumb-bell, one core thus being used for two castings. In the centre of the print is a small raised piece which coincides with one on the pattern, this being done so that the core can be set by simply dropping it into the print, the raised piece preventing it from being placed further into one casting than the other (which would alter the weight), besides doing away with the use of templates for setting. The ventway before mentioned also leads away from this part of the core.

Each core-box is made in three portions, two being the box proper, the other a dummy part. They are made as follows:—The bottom half is rammed with sand and the core-iron and vent-wire placed in position, then the dummy part placed in position and also rammed up. After taking away the dummy, the core is left, the core being given its correct shape by putting on the other part and giving it a few smart taps with a wooden mallet. The vent-wire is now withdrawn, the core released from the box, and the hole made by the wire made up, as a passage for the escape of gas is formed by the small stud on which the wire rests whilst the core is being rammed. This method gives a core that is perfect in size and shape, and does away with making the core in two halves and pasting them together. By using the first method, cores could be made at about twice the rate of the pasting method.

Oval Grenades.

For the oval grenade, the "Adaptable" machines are used and also the same type of boxes, but with 12 castings in one box. These grenades have 12 grooves running from top to bottom, and also three round the body, the latter being formed in the machine shop, so the castings have to be made on their ends, one core for each, which is set by template. To get gas away from core, a wire is pushed down every print, also underneath the boxes. A vent is made through the top of the mold to conduct away air in the mold.

The core-box from which the cores are made is somewhat of a novelty. It is in two halves, hinged on one side, and, when closed, is secured by a catch. Into one half a hole is drilled in which is placed a spring strong enough to force the box open when the catch is released. To use the box it is closed and the sand rammed through the print until the box is filled, a core wire inserted and also vented. After tapping very lightly the core-box is turned over and the catch released, allowing the box to spring open, leaving the core intact. Before using this spring the core has to be turned out on the hand, for if the box be opened on the bench the core is generally knocked over or remains fast in one half. The sands, both facing and core, are the same as for the round grenades.

The iron for these grenades must be close, but also easy to machine; and as they are very thin in section suitable irons must be used that will not chill on the edges which have to be machined. The following irons are used in the particular case under consideration:—1½ cwt. Staveley No. 3; 1½ cwt. Glengarnock No. 3; 2 cwt. Thorncliff No. 3; 6 cwt. good machinery scrap. As no complaints have been received in connection with this, it can be taken as being as satisfactory as any other for this class of casting generally.—Foundry Trade Journal.

SCRAPPING VS. REPAIRING

AN English author has characterized the American manufacturer as a man 'who scraps instead of repairs,'' says a writer in the Woodworker. Whether this is considered as a criticism or a compliment depends upon the point of view. With more expensive labor, the American manufacturer has been compelled to look for enough efficiency in his machinery to overcome this handicap and to meet competition. It has often been cheaper for him to scrap an old machine and install a late model that would increase his production. In fact, some of the most successful manufacturers have not hesitated to scrap comparatively new machines, when investigation showed that a newer type would materially increase production.

The man who holds the coin so close to his eye that it eclipses everything else, is not exactly a stranger, though rapidly dropping out of sight. The successful man is the one who holds the coin at a distance that allows a proper perspective, and hastens to spend it when his judgment assures him that the spending is really an investment.

* * *

It oftentimes requires courage and patience to wait for opportunity, but it is worth not only working but waiting for, and initiative and good practical ideas, combined with energy and enthusiasm, are sure, sooner or later, to bring their just reward.

CONTEMPORARY WAR ARTICLES

Embracing Information and Data Drawn from a Variety of Sources Relative to and Arising from the Prosecution of this Many-Sided European War

FORGING DEPARTMENT OF A BRITISH NATIONAL SHELL PLANT

IN previous issues, through the courtesy of our British contemporaries, The Engineer and Engineering, we were able to place before our readers more or less extended and illustrated descriptions of typical munitions manufacturing plants, erected and equipped by the Imperial Government for the purpose of shell forging and machining These establishments numerous and on a comprehensive scale as regards capacity—have been built by Government money, although designed, equipped and operated each by a private company which has achieved distinction in some specific line of manufactured product. Such plants are supplementary to the Government arsenals and old-established private munitions works. They receive steel in the form of billets and forge and machine shells therefrom. They are not concerned with the loading of the shells nor with the production of the fuses, although making the steel nose pieces, which are screwed into the ends of the shells. Another of the plants is described in a general way in recent issues of The Engineer, which says that nine-tenths of the battle in the manufacture of modern artillery projectiles is the production of the steel shells. From the first of these articles are taken the following notes:

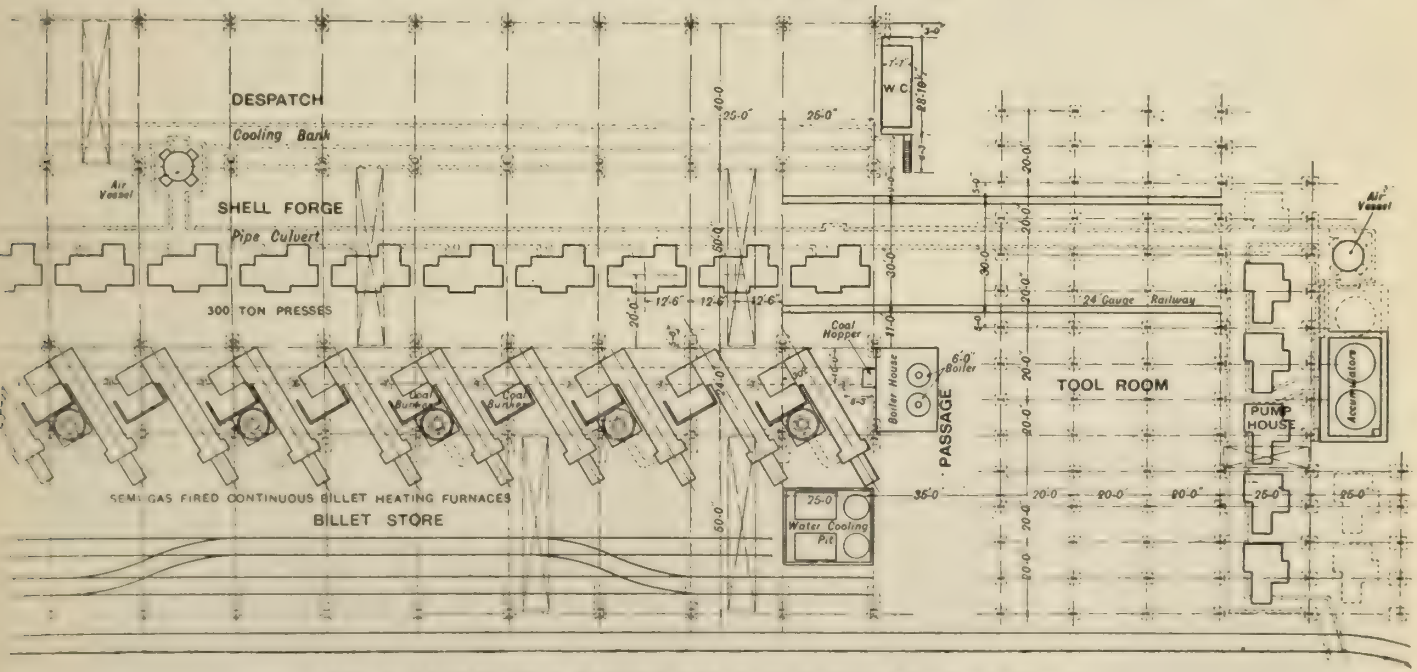

FIG. 1. LAYOUT OF A BRITISH NATIONAL SHELL FORGING PLANT.

Incidentally, there is no reason why a shell should not be completely machined on a single lathe. Such a lathe, however, would not be a simple machine, because it would require to have as many adjustments as there are operations to perform on the shell, and none but a skilled workman with long training could readily learn to operate it. Instead, therefore, of designing and making a lathe capable of performing the fourteen or so operations required on a shell, fourteen different types of machine have been constructed, each of which specialized to do a single one of the operations and no more. The simplification of the mechanism in each case has been carried to a truly remarkable degree, and as a result girls and others without previous acquaintance with the inside of an engineering shop are taught to use the different machines efficiently in anything from a fortnight to a month.

The factory consists of two distinct departments. In one the shells are rough-shaped by forging. They are then taken on railroad cars to the second part of the factory about a mile or so away, where they are machined to shape and size, bored internally, screwed at one end for the nose pieces, varnished inside and painted outside.

The factory when visited was engaged on the production of 60-pounder high-explosive shells. The raw material as received consists of billets of steel some $4\frac{1}{2}$ in. square, 15 in. long, and weighing about 80 lb. The steel has a breaking load of about 90,000 lb. per square inch. The billets arrive by rail in trucks, which are run on to the siding shown at the bottom of the plan of the shop, Fig. 1. Between this line of rails and the row of furnaces the ground is used as a billet store. At any given moment some thousands of billets will be found here arranged in stacks. On a pair of overhead girders, one along each edge of the storage ground, three overhead electric travelling cranes run in a direction parallel with the line of rails. These cranes, instead of using hooks and slings, are provided with powerful electric magnets. Five billets may thus be lifted at one time by each crane.

The billets as required are lifted by the cranes from the stacks and carried over to the furnaces. Each furnace is provided with a shutter-like door on the side nearest the storage ground. Just outside this door and level are deposited from the crane magnet. The table is provided with a horizontal hydraulic ram. The door of the furnace being lifted, the ram is operated and pushes the billets in a row off the table into the furnace. As fresh billets are added at one end, those nearer the other are, through the action of the ram, pushed forward towards another door, through which they are withdrawn, when heated, by the forge hands. The heating of the billets thus proceeds continuously—that is to say, there is always a hot billet ready to be withdrawn. Fig. 1 describes the furnaces as being "semi gas-fired." This means that the fuel used is coal and that the coal is gasified within the furnace itself. The billets are heated by the combustion of the gas and not by the actual combustion of the coal.

Forge Department

A row of hydraulic forging presses is arranged down the centre of the forge shop. Each furnace serves a separate press. From a point above the furnace outlet door to a point on the press structure a stout wire rope is stretched. On this runs a pulley from which a chain depends. To the chain a pair of tongs is attached. The white hot billets can thus be readily and quickly, one at a time, pulled out of the furnace and carried over to the press. On the way across any scale formed on the surface of the billet is knocked off with pointed bars of steel. The corners of the billet as received are rounded off so that the length across the diagonals is about equal to the diameter of the forging. This permits the billet to be readily slipped into the round mould or container. It will be noticed that the length of the forging is slightly greater than that of the billet.

The hydraulic presses are operated by water under a pressure of 1,200 lbs. per square inch. They are of the vertical type and consist of a bed-plate, upon which four pillars are erected. The main hydraulic cylinder, which does the forging work, is inverted, and is carried by these four pillars. The bed-plate also carries a pair of guides upon which there runs a carriage carrying two large steel pots, within each of which is placed a steel mould or container. The carriage with these pots is moved to and fro on the guides by a horizontal hydraulic cylinder. Each pot alternately can thus be brought under the forging cylinder.

At each end of the bed-plate a small vertical hydraulic cylinder is sunk into the ground. The rams of these cylinders are used to eject the finished forgings from the mould in which they have been formed. It is necessary to provide this power because, after forging, the metal being expanded tightly against the walls of the mould, is apt to stick. It is arranged that when pot A is under the forging cylinder pot B is over its ejecting cylinder. Thus, while one billet is being forged the preceding one is being ejected.

The ejector ram when it rises enters a hole in the bottom of the pot. Rising further, it enters a similar sized hole in the bottom of the container or mould. This hole just fits the diameter of the ejector ram and is smaller than the diameter of the finished forging. In sections, therefore, the container or mould shows a round bore of diameter equal to that of the forging and is carried to a depth which exceeds the length of the untouched billet by a short amount. At the foot of this bore comes another one of smaller diameter, equal to that of the ejector ram. On the circular step thus formed a round plate rests loosely. This supports the bottom of the billet while it is being forged, and can rise on top of the ejector ram when the billet is forced out of the mould.

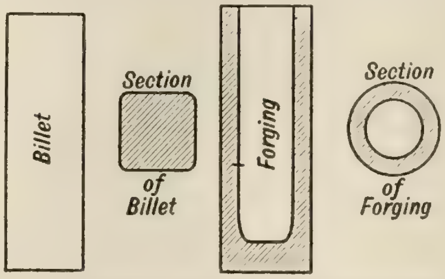

FIG. 2. SHELL BILLET AND FORGING.

The Forging Process

There are two punches on each press, these being mounted on a slide which can be moved in a direction at right angles to the guides on which the pots run. Just as these pots are brought alternately beneath the forging cylinder, so, too, are the punches. The two punches are so connected that they move in unison. Thus, when punch A is being forced by the ram of the forging cylinder into the billet, punch B is also descending. In so descending it passes into a pot of water where it is cooled. It is then ready to be moved across into the forging position and to deal with the succeeding billet. It will thus be seen that while one billet is being forged the preceding billet is being ejected and the succeeding billet being got ready in position. Simultaneously, the punch for the surrounding billet is being cooled.

To permit the punch to be withdrawn from the shell without dragging the shell out of the mould, two bars are fixed across the top of the pot at a distance apart which will permit the container or mould to pass between them as is required when the mould has to be replaced. When the forging is over, except for the withdrawal of the punch, a vee-shaped block of steel is slipped beneath these bars. The limbs of this block pass on either side of the punch. The bottom surface of the block rests on top of the mould and overlaps the lip of the shell. With this block inserted, the punch can be withdrawn, the block and the bars meanwhile holding the shell down.

First Inspection

Immediately after forging, the shells are inspected, and if found in order, passed and stamped by Government inspectors. An interesting mechanical device is in use to assist in the inspection

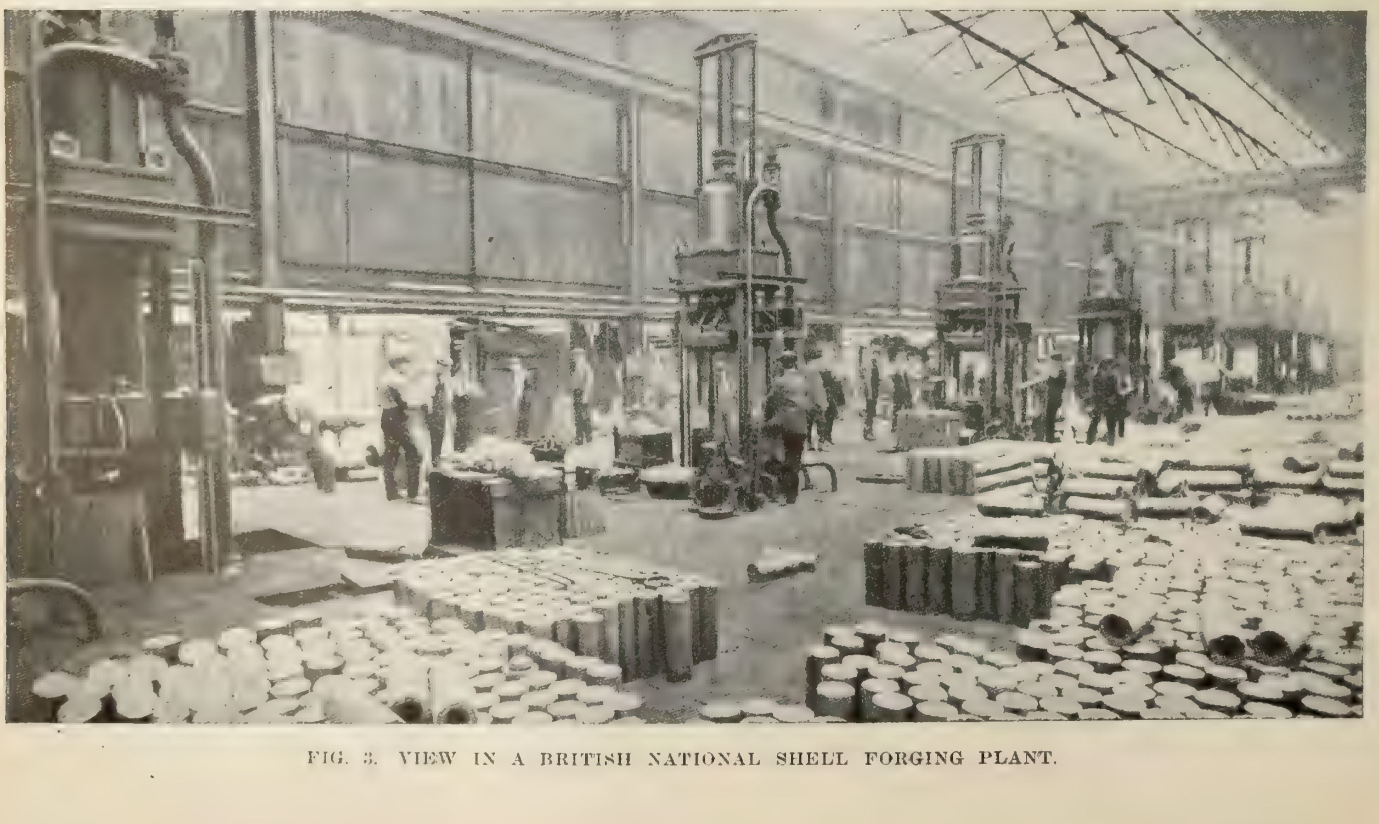

FIG. 3. VIEW IN A BRITISH NATIONAL SHELL FORGING PLANT.

process. It is intended to detect any shells which have been forged eccentrically. Precautions are taken at the presses to see that the punches and moulds are correctly aligned, but even so eccentrically forged shells are sometimes turned out.

The device referred to is sketched in Fig. 4. A is the end of the shell. B is a lever, one arm of which is provided with a roller which rests on the surface of the shell at a point near its closed end. The other arm of the lever is a pointer. The shell is slipped over a power driven spindle C, which just fits its bore. When it is rotated, the end of the pointer must not pass outside two gauge marks D inscribed on a board fixed behind the pointer. If it does, the shell is too eccentric to be passed. The eccentricity is thus examined at the closed end of the shell. If there is any eccentricity it will be most marked at this point. The device enables a large number of shells to be inspected in a very short time.

Upkeep and Labor

The containers, the punches and other parts of the presses have frequently to be renewed. The renewals are made and carried through by the staff of the tool room, the situation of which is shown on the plan. Beyond the tool room is the pump house, which supplies the pressure water used by the forging presses. Here are to be found electrically-driven pumps, each with three rams and all delivering into an accumulator. The current to the motors driving the pumps is controlled automatically in such a way that as the demand for water increases or decreases more and more of the pumps start or stop working.

A word may be said in conclusion regarding the staffing of the forge departments. At present no female labor is employed in the forge itself, nor is it probable that it will be in the future, at least in the forge proper. The heat here is somewhat trying, and it is believed that male labor alone is suitable. The men actually employed were all quite untrained for the work to begin with. On the average, however, fourteen days is found sufficient for instructing them in their work.

The tool room is staffed by both male and female labor. The portions of the presses actually coming into contact with the hot billets require very frequent renewal, particularly so in the case of the punches and their components. Arrangements have, therefore, been made for the production of these articles on the principle of specialized working, and the greater part of this work is carried out by women. The renewal of parts of the valves, however, and other delicate adjuncts of the presses remains in the hands of skilled male workers, who are also responsible for the management of the workshop and the instruction of the women.

DON'TS FOR THE GRINDING MACHINE OPERATOR

Howard W. Dunbar.

(1)—Don't attempt to grind without using the proper number and proper application of steadyrests, if you wish the work to be round, true and smooth.

(2)—Do not expect to get round work without round centre holes in your work and true centre points in your machine.

(3)—Don't attempt to grind without a quantity of good lubricant flowing over the work and wheel at the point of contact between wheel and work.

(4)—Don't put too much compound in the water; the proportion should be about 40 to 1; too much compound causes undue foaming.

(5)—Don't allow compound to foam and froth and run all over the machine and the floor. This can be reduced by sprinkling a little kerosene on the foam in the top of the tank, or by adding several pails of clear water.

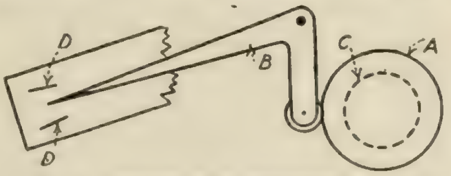

FIG. 4 DEVICE FOR TESTING ECCENTRICITY OF SHELLS.

(6)—Don't thin the compound so much that there will be no rust preventive in the water; if you do your machine will become rusty and corroded.

(7)—Don't use hard wheels; soft wheels give greater production.

(8)—Don't forget to oil the machine thoroughly at least once each day, preferably on starting up in the morning.

(9)—Don't use "any old oil" on the wheel spindle. Special spindle oil is provided for and necessary, due to the amount of clearance left between the diameter of the spindle and the diameter of the box, where clearance must be just filled by the oil used. Therefore, the oil must be of the proper grade and viscosity to accomplish this object.

10)—Do not worry if the wheel spindle runs warm or cold, so long as it grinds round, perfect work.

(11)—Don't attempt to take too deep cuts; lighter cuts and more of them will produce as much work and still keep the wheel true and in better shape for a greater length of time. Still you must use good judgment; excessively light cuts will permit the wheel to glaze over and not cut properly.

(12)—Don't forget that a generous use of the diamond yields large returns in dollars and cents.

(13)—Don't attempt to grind round work with a wheel that is out of balance. You should try the wheel for balance as it wears down; one balancing is not sufficient to insure a wheel remaining in balance throughout its entire life.

(14)—Don't try to grind without chatter marks when all the belts on the machine are uneven in thickness and bumping every time they pass over the pulley.

(15)—Don't try to grind work in your machine which is beyond the capacity of the machine both for length and swing.

(16)—Don't remove the wheel spindle of your grinding machine just for examination of the bearings.

(17)—Don't expect perfect bearings in the box of the wheel spindle for such a thing is impossible and unnecessary.

(18)—Don't press the point about the bearing in the wheel spindle box, because if the spindle is round you will get perfectly smooth rotation in a box, even if it only bears at three points.

(19)—Don't say that chatter marks are caused by imperfect scraping of wheel spindle box bearings. Scraping never was and never can be the cause for chatter marks.

(20)—Don't undertake to adjust the wheel spindle boxes unless you have had experience with such work.

(21)—Don't forget that nine-tenths of the trouble in this world is due to ignorance. So if you are not familiar with certain features of adjustment about the machine, don't attempt such adjustments until you are thoroughly acquainted with just how they work and how they are used.

(22)—Don't pound on the swivel table of the machine with tools, hammers, wrenches, etc., to make it move. If you swivel the table through its entire movement and clean it once a week, it can be moved without pounding.

(23)—Don't expect the machine alone to produce a fine finish; there is a good deal in the operator's knowing how.

(24)—Don't forget that the smoother the point of the diamond, the smoother will be the finish on the work.

(25)—Don't think of the diamond as sharpening the wheel, but rather as correcting the surface.

(26)—Don't expect to succeed in quantity or quality of work without having a diamond constantly at hand.

(27)—Don't use a wheel narrower than 2 in. except on special work which requires a narrower wheel.

(28)—Don't expect wide wheels to grind the same as narrow wheels; generally, the wide wheel is required to be a little softer.

(29)—Don't expect the machine to run itself; success in grinding depends upon constant attention and care in the operation of the machine.

(30)—Don't expect to get a "looking-glass finish" when the wheel is cutting freely.

(31) Don't run the diamond across the wheel rapidly if you wish a good smooth finish, as such a procedure will cause the wheel to be imperfectly trued and mottle marks are apt to appear on the work.

(32)—Don't run the diamond too slowly across the wheel if you wish the surface broken up so that it will cut freely and quickly.

(33)—Don't complain that diamonds wear out too quickly; diamonds are profitable—whatever their cost — in the hands of experienced operators.

(34)—Don't forget that cleanliness is as necessary at the machine as at our homes. We must wash our faces at least once a day. Why should it be a hardship to clean a machine two or three times a week? A good operator is generally known by the appearance of his machine.

(35)—Don't forget that the greatest mistake a man can make in life is to ignore the experience of an older man. —Grits and Grinds.

UNORTHODOX PATTERNS

By J. R. Moorhouse.

IT is admitted there should be no excuse for an unworkable pattern, but there are occasions when conditions positively compel the patternmaker to pass on to the foundry patterns that are scarcely worth the name. These add considerably to the foundry costs, and result in unsatisfactory castings—a very questionable economy. Apart, however, from these, a pattern may be quite practicable and leave much for the moulder to do to complete his mould. Of such nature are the "one-off" variety of patterns; and just where the line should be drawn in regard to what should be done in the pattern-shop and what left for the foundry to do, in view of the entire cost, is of itself a controversial subject. When patterns are required for standard work, too much consideration cannot be given to saving labor in the foundry. Such patterns should be built up in the best possible manner for repetition moulding.

It is here where the patternmaker is often in a difficulty. Though expense may be no consideration, time is vital to the making of a reliable and efficient pattern. As ideas are perfected and laid out in the drawing office, there is a rush to get these going in the pattern-shop, so that some tangible result may be seen in the shops as soon as possible. The daily reminder and inquiry, how soon these are to be sent on to the foundry, is no encouragement to thoroughness, neither is it conducive to the best of relations between the foundry and pattern-shop.

Pattern-Shop and Equipment

Given adequate and up-to-date machinery, arranged to the best of advantage in a well-lighted and ventilated building, the most vital factor in getting out good work and workable patterns cheaply and quickly is ensured. Of a secondary consideration in the make-up of a pattern is the materials used; and although timber will remain the standard for most classes of work, against which no other material can possibly compete, there are occasions when plaster-of-Paris can profitably be used for the quick production of patterns, not for the saving in the price of the material, but rather because it so readily can be worked up into intricate shapes that otherwise would require considerable labor if worked out in timber.

Plaster-of-Paris in Pattern-Making

To the wood pattern-maker this necessitates what, to him, are unorthodox methods of procedure in pattern construction. The use of plaster-of-Paris in the pattern-shop, as is well known, is not new; the writer in his early apprenticeship worked plaster for patterns. It was then used for making accurate forging-tool patterns, one example being a railway carriage draw-bar hook. A model of the hook to be forged is first made in halves in wood. This is then passed by the inspector to check all sections, etc. A frame is next made to conform to the dimensions of the forge block required, and deep enough to leave ½ in. of plaster at the shadow portion covering the hook face; nails are then driven in the inside with the heads protruding well out, to form an anchor for the plaster. One half of the hook, which has previously been varnished and thinly smeared with oil, or preferably vaseline, is secured to a board, on which is placed the frame, over and in correct relation to the hook. Having made this secure, the plaster is run in and strickled flush with the frame edges. In a few moments the board can be inverted and the hook carefully withdrawn, leaving a perfect impression of the hook in the plaster pattern.

It needs no argument to show how much quicker this can be accomplished than working the hook by trial and error into a wood block. To form the top stamping block the process is very much the same, with the exception that the two halves of the hook are placed together as a means of registering the top in true relation to the bottom, so that the stampings will not be overshot, being then put back in the already half-formed plaster pattern, on which is fixed the mating frame for retaining the plaster forming the top half block. This is weighted and then run in with plaster. When set it can be carefully removed, leaving a true impression of the model. The same procedure is often followed in jobbing lines of valves and intricate inlet pipes, etc.

Strickle Work and Plaster-of-Paris

A little experience is necessary, especially on strickle work to manipulate the plaster to the best advantage, as when once it commences to set it cannot be restored without seriously impairing the strength of the pattern. The amount of plaster to use to a given quantity of water varies according to the nature and grade of the material, as also the temperature of the room in which plaster patterns are to be made. A good method is to lightly and quickly sprinkle the plaster over the whole surface of the water, until it begins to settle on the surface. This is then thoroughly mixed, preferably with the hand, until it has a creamy nature, when it can be then run off. For strickle work it may be necessary for the first coat to run it a trifle stiffer, and thinner on the finishing layer. These, however, should follow immediately, if possible, one on the other, to form a bond for the best results. Especially is this necessary on thin strickled sections, where it is found impossible to complete it at one operation.

It should be mentioned that a useful material for working along with plaster-of-Paris, and which widens the field of application for pattern construction, is plasticine, a class of modelling clay. With this material, holes or pockets can be readily formed in plaster moulds, in the same way as cores are used in the sand mould.—From a paper before the Lancashire Branch of the British Foundrymen's Association.

Protection of Iron by Enamelling.—A method of enamelling iron, consists of the following:—The metal is first pickled in hydrochloric acid to free it from foundry scale, then washed thoroughly and dried. The first coating applied is composed of 34 parts silica, 2 parts soda, and 15 parts borax, mixed in water. The metal thus coated is exposed for 10 to 15 min. in a dull red-hot retort. A second coating is then applied, consisting of 34 parts feldspar, 19 silica, 24 borax, 16 oxide of tin, 4 fluorspar, 9 soda, and 3 saltpetre. This mixture is first melted in a crucible, then ground to a fine paste in a little water and applied with a brush. The coated piece is then again subjected to white heat in a muffle. It is claimed that the enamel unites with the iron and that pipes thus enamelled have been in use for many years without deterioration.

MACHINISTS' INSTRUCTION COURSE—I.

By J. Davies.

THE machinist or engineering trade is one that any young man might well be proud of, it offers unlimited scope for the display of inventive genius and calls forth the highest degree of skill and sound judgment, an error of one thousandth part of an inch being taken quite seriously in some of our Canadian high grade tool making establishments. The ordinary lathe hand is expected to be able to work within five thousandths of an inch as that amount more than represents the difference between a loose and tight fit.

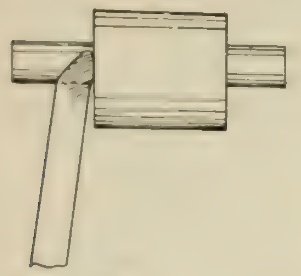

FIG. 1.

Commencing Studies.

The first advice I would offer to the boy entering the machine shop is to join some evening school technical class, where he can acquire a knowledge of machine drawing and construction and workshop mathematics. Although it will be some time before he is called upon to work from a blue print it is a good plan to begin to learn reading a drawing as soon as he enters the shop, then when the time comes that he is expected to work from a blue print he will not have to be continually chasing the foreman around to know what every little thing means. If you think you are a smart boy don't let the men know that you think so. A certain amount of confidence in your own ability is necessary for your success, but don't let that confidence develop into conceit. You may expect to be fooled a few times by being sent after the left-hand monkey wrench, or some other tool that only exists in the imagination of the man who sent you after it. When you find that you have been the victim of a practical joke, don't get angry, anger does not improve anything except the arch of a cat's back; take it as a part of your workshop education and you will soon make friends .

Regarding Left Hand Tools.

Don't imagine because you were fooled on being sent after some imaginary left hand tool, that there are no legitimate left hand tools. There are left hand dies, taps, side cutting tools for lathe planer and shaper, cutting off tools, knife tools, threading tools, hobs used on milling machine and gear cutter for making worm wheels. Remember that a left hand side tool or knife tool is bent toward the right and is called left hand because it is used for cutting the left hand side of the work or job that is in hand, see Fig. 1.

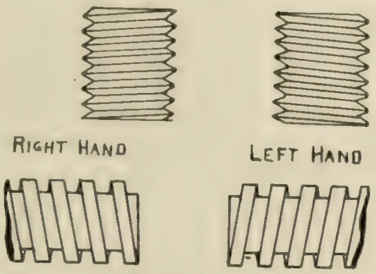

FIG. 2.

To distinguish a left-hand tap or thread take a pencil point, a nail, a piece of wire, or anything that is handy. You do not need an elaborate kit to place the point in the thread somewhere about the centre and move it around the thread clockwise—if your hand travels towards the top it is right hand; if towards the bottom it is left hand. Make a sketch of a left and right hand thread and fix it definitely upon your memory. If the thread inclines upward from left to right it is right hand, if it inclines downward from left to right it is left hand, see Fig. 2. A little study of this will fix it definitely upon your memory and you will find it a very useful thing to be able to distinguish right from left at a glance.

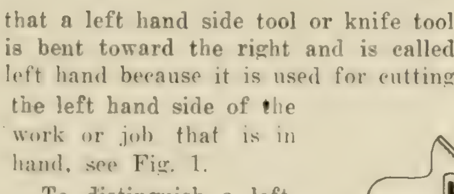

FIG. 3.

The only exception to this rule is a sectional elevation of a nut or internal thread such as a thread inside a handwheel. When an internal thread is shown in section it reverses the angle, because you are looking at the opposite side of the thread to what you are in elevation or outside view. It is here illustrated by making a section of the threaded boss of a press, see Fig. 3, in which it will be seen that while they are both right hand, the angle of the sectional elevation inclines in the opposite direction to the screw. The amount of the inclination is equal to half the pitch, that is half the distance of one thread from the other.

Get Tools of Your Own.

Study in order to become familiar with all ordinary shop tools and their uses. Plan to get some tools of your own as soon as possible as the youth that is always running around borrowing and returning tools soon gets in disfavor with both men and masters. You do not need an elaborate kit to begin with—a hand hammer, a combination set comprising square, bevel protractor, spirit level, and centre finder, and a 12-inch scale with square ends graduated on 4 edges, a 6-in flexible rule, a pair of dividers and a small pair of inside and outside calipers. Combination tools are more likely to be inaccurate than tools made for a single purpose. When buying a combination set, have them tested in the workshop and if you find them inaccurate to any appreciable degree the makers will gladly exchange them and thank you for calling their attention to the fact. It is not often that you will have any room for complaint if you buy your tools from some well known maker, but

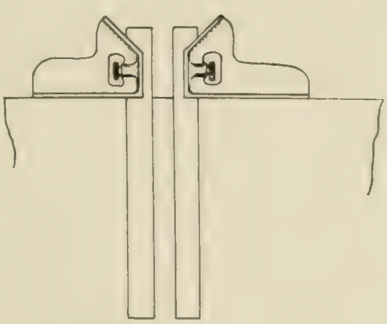

FIG. 4.

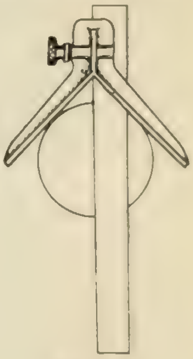

FIG. 5.

it gives you more confidence in your work if you know that your tools are correct.

Test your tools as follows:—(the method here described for testing your tools can be applied to a great variety of other jobs). Testing a combination square,—put in your 12 in. blade as shown in sketch 8, Fig. 4, taking care that there is no dirt or grit in the slot of the stock where the blade goes in, place the base of the stock against the planed edge of a surface plate or marking off table then make a fine line close up against the blade, reverse your square as shown, and draw another line parallel with the first one, leaving just as small a space between the two lines as the eye can detect, or you may draw one line exactly on the top of the other. If the two lines thus drawn run exactly parallel your square is correct, if the lines do not run parallel the error in your square is equal to half the error shown by the lines. Now take out the blade and turn it upside down to test the other edge, or you may try it with micrometers to see if it is parallel which amounts to the same thing.

Testing Tools.

To test your center finder, you practically repeat the same operations, except that instead of the surface place, or marking off table, you must get something that is perfectly round. The end of a short shaft turned and faced in the lathe, or the end of a plug gauge will serve very well, the diameter being such as will allow the sides of the center finder to bear somewhere about the middle, see Fig. 5.

To test a spirit level place it upon the surface plate, and pack up the plate, not the level, until the level shows perfectly level, then draw a pencil mark around the edge of the base of the level, reverse the level placing the base inside the pencil marks, and if the level still shows true it is true. If you are testing an adjustable level, adjust it until it fulfils the conditions as stated. If your level is not adjustable then you will have to scrape, file, or machine the base of your level to correct any error there may be in it.

To test your protractor—Since there are 360 degrees in every circle, if two lines forming a square or right angle are placed inside a circle, they will divide that circle into exactly four equal parts, and as 360 divided by 4 is equal to 90, the angle of the square will be 90 degs. Therefore set your blade at 90 degs. and test exactly as you did for your square, if the base of the stock does not form a perfect square with the edge of the blade, it follows that every other angle will be out an equal amount.

ERECTING AND OILING THE LATHE

THE following observations are taken from the Lodged Shipley "Lathe Operating Manual." They will be of interest to our readers not only on account of the primary intention, but because of their application to lathes generally.

Cleaning

Use benzine to remove the slush compound from the finished surfaces of the lathe. Let this clean-up be thorough, and be sure to remove every particle of grit or dirt from all bearing surfaces. Carefully clean out all of the oil holes, so that no dirt will be carried into any journal with the oil. The sliding tumbler gear under the headstock and the slip gear on the lead screw should work easily. The cross slide guard or extension of the lower compound rest slide should be removed by running the slide to the centre of the carriage; the guard may then be lifted off, the dovetail surface of the bridge cleaned and oiled, and guard replaced.

Foundation

A good, solid foundation is essential to best results in accuracy, rigidity and smoothness of finished work. Money spent to secure a solid base is true economy. Be sure the foundation is thoroughly laid before the lathe is placed. Never bolt the legs to the floor. The holes in the legs are for the lag screws which secure the lathe to the skids when crating it for shipment.

Levelling

No lathe can do good work or accurate work if it is not levelled exactly. Use a level which is very sensitive and accurate. A carpenter's or similar level is utterly useless for levelling a lathe bed. First lay the level on the flat track lengthwise with the bed, that is parallel with the track, and carefully level the bed lengthwise. Now place the level upon a straight edge which rests on the front and rear arms of the carriage, having the carriage close up to the headstock, and carefully level the bed by the head end leg. Move the carriage along the bed, letting it rest over each successive leg, and level the bed by that leg.

In preliminary levelling, leave the middle legs a trifle low rather than too high. Do not disturb the position of the level across the wings. Do not lean against the lathe. After having traversed the whole length of the bed as described, move the carriage again to the head end and repeat the operation to make sure that there is no wind. Grouting may, if desired, then be run under and around, but not over, the feet. No bed, no matter how strong, is stiff enough to prevent springing out of line when set on an uneven base; and in such a codition it is impossible to face or turn straight; hence the levelling of the bed is of the utmost importance to obtain smooth and accurate work.

Oiling

Ample and proper lubrication is essential to secure good results and preserve the bearings. It is false economy to use any but the best mineral oil, rich enough to lubricate the bearings, and with body enough to last a reasonable length of time, and with a 20 degrees cold test. Animal oil has a tendency to gum and clog the oil tubes in cold weather. Each lathe is thoroughly oiled before leaving the shop, but, after being cleaned and set up, all the bearings should be flooded with oil during the first few weeks of operation. The oil reservoirs on the spindle bearings of the headstock hold sufficient oil for a day's run under ordinary conditions. Where oil holes are plugged with wood, the regular oil cover or oil cup will be found in packing box.

To Ensure Accurate Work

If your lathe should not bore straight, level it carefully with a good level as already described. This will entirely overcome the difficulty.

If your lathe should not face straight, it also is merely a matter of levelling.

If your lathe should not turn straight, use the same levelling operation and then carefully test to see that the centres line up exactly with each other. Remember that if a long piece is turned between centres without steady or follow rest support the work itself will spring away from the tool to some extent.

If your lathe should chatter, it might be due to any one of several causes:

Improper levelling; correct as above.

All four feet not resting solidly on the floor or on wedges.

Work extending too far from chuck; change method of chucking or run outer end in steady rest.

Too great a distance between centres without support on slender shaft; use steady rest.

Inaccurately fitted chuck plate.

Bolts which hold chuck to chuck plate not tight.

End play in the spindle; adjust by means of the collar and nut on rear end of spindle.

Cross slide not fitting the bridge tightly; adjust gib.

Compound rest gib loose; adjust.

Cutting edge of tool below centre.

Dirt between one of the centres and its bushing.

Tool not securely clamped in tool post.

If using a tool holder, the set screw holding the inserted cutter should be tight.

Machine thrown out of balance—by addition of special chucking fixtures;

by being speeded too high on some classes of work.

If your lathe should cut a drunken thread, tighten the nut on the tailstock end of the lead screw, if that nut is too loose. On the other hand, do not make the nut too tight, as it would then be difficult for you to get the sliding tumbler knob into the holes when the lathe is running. The lead screw is always in tension whether you are chasing right-hand or left-hand threads, because the pull is against the outer end of the bearing in either case.

Should you have occasion to remove any of the gears from the reverse plate, be sure, when replacing them, that they are properly located by the dowel pins.

Never leave your lathe with the chuck wrench remaining in the chuck some one else might start up the lathe.

OUR 1916 IRON AND STEEL OUTPUT

OFFICIAL figures compiled by the American Iron & Steel Institute show that the production of pig iron in Canada in the first half of the current year was 40 per cent. ahead of production in the corresponding period of 1915, and 11 per cent. ahead of production in the last half of that year. At the rate of production in the first half of this year it is possible, if not likely, that the output for the full twelve months will exceed the high record established in 1913.

The total production of pig iron up to June 30 of this year was 507.750 tons and compares with 366,825 tons in the first half of 1915, 458,595 tons in the second half, and 1,015,118 tons for the full twelve months of the record breaking year of 1913.

Production of steel ingots and castings in Canada, according to the Institute, promises to break all records in 1916. Last year, production was very near the high record of 1,042,503 tons in 1913. The output in 1915 was 912,755 tons, compared with only 743,352 tons in 1914, an increase for the year of approximately 22 per cent.

The figures are interesting as official confirmation of the results achieved by the Canadian manufacturers in their effort to overtake an insistent demand, which has promised not only a market for all that can be produced, but a market at extremely attractive prices.

Pig Iron

The following table shows the production of pig iron in grades in 1915 and 1916

	First Half 1915	Second Half 1915.	First Half 1916.
Basic	292,556	307,813	388,387
Bessemer	5,228	8,476	12,575
Foundry, etc.	59,646	66,123	95,602
All other	9,385	6,183	11,186
Total gr. tons..	366,825	458,595	507,750

The output of pig iron, though larger in 1915 than in 1914, was still far below the record of 1912 and 1913. Production for 1915 amounted to 825,420 tons, compared with 705,972 tons in 1914 and the high record of 1,015,118 tons in 1913. Basic pig iron was the only grade showing larger output than in 1913 and 1912. The production of this grade of pig iron was 660,369 tons, compared with 558,524 tons in 1913 and 489,799 tons in 1912. Following table shows production of grades of pig iron from 1910 to 1915:

Years	Basic	Bessemer	Foundry	All Other	Total
1910	..365,000	221 494	143,986	9,640	740,210
1911	..413,303	186,274	190,324	34,467	824,368
1912	..489,709	228,742	194,208	129	912,878
1913	..558,524	227,662	225,231	3,701	1,015,118
1914	..331,456	184,053	174,346	16,117	705,972
1915	..660,369	13,714	125,769	25,568	825,420

Steel Production

The following table shows steel production since 1910:

Year	Open-Hearth	Bessemer	Other Kinds	Total
1910	542,354	199,570	....	741,924
1911	601,074	189,797	....	790,871
1912	645,062	207,569	400	853,031
1913	768,663	273,391	449	1,042,503
1914	556,910	186,158	284	743,352
1915	884,736	22,521	5,498	912,755

Production of steel rails in 1915 was far below the production of any year since 1905. Since that year, excluding 1915, output of steel rails in the Dominion has averaged in excess of 364,000 tons a year, comparing with only 209,752 tons in 1915. As will be seen from the following table, other finished rolled forms of leading products have equalled or exceeded previous year's outputs:

Product	1912	1913	1914	1915
Rails	423,885	506,709	382,244	209,752
Struct. shapes and wire rods.	64,082	68,048	59,050	114,829
Plates & sheets, nail plate, merchant bars, tie-plate bars, etc.	373,257	392,340	218,125	328,737
Grand total, tons	861,224	967,097	659,519	653,318

Miscellaneous

Production of wire nails in 1915 is estimated at 1,636,000 kegs of 100 pounds, as compared with 1,144,000 kegs in 1914, an increase of 492,000 kegs, or nearly 5,000,000 pounds. Output of cast iron pipe amounted to 53,700 net tons, as compared with 93,200 tons in 1914, a decrease of 39,500 tons.

EVERY MAN TO HIS OWN TRADE.

By J. H. R.

THERE are very few men who have not, at some time, been placed in a position of humility, on finding they were forced to relinquish a task they had ,at first considered as very simple. It seems to be a trait of human nature to think we are capable of performing certain tasks, as well, if not better than the other fellow, who in many instances has spent several years of his life in acquiring the necessary knowledge for the successful accomplishment of his allotted duties.

Some years ago, while working in a jobbing shop, I was turning the outside of a large cylinder, about 30 inches long. When noon hour arrived, there remained a portion of about one inch to complete the cylinder and as I would not be on hand in the afternoon, I disengaged the feed but left the tool in position, expecting to rough off the remainder in the morning. Upon my return I noticed that a portion about 3/8 inch long had been very roughly torn off. Upon making inquiries of one of the men, I learned that the office superintendent had endeavored to complete the job, with the above result. His effort proved very discouraging, for he finally left off and returned to the office. Under ordinary conditions, he might have achieved his purpose, but as this particular lathe was badly worn, it required careful handling for satisfactory results. To start a cut, it was necessary to take up all the slack in the apron gears before engaging the friction feed, and even then it would be some little time before the saddle would commence to move. As these conditions were not known to the "Supt.", he had tried several handles with no apparent result, finally trying to finish the cut by feeding with the hand wheel.

Another case of mistaken ability was that of a preacher, who anticipated, without much trouble, making a joint in a water pipe connection. Having obtained an ordinary flat faced union and a quantity of red lead from an engineer next door, he started in to do the "little" job. A few hours later, the engineer was called in for advice, to find the preacher covered from head to foot with red lead and perspiring freely in an effort to stop the joint from leaking. The engineer looked at the job, shut the water off, released the union with great difficulty, as the other had been using brute strength (pardon the expression) in trying to get a tight joint, inserted a rubber gasket, replaced the nut, and when the water was turned on, no leak was evident. The preacher thanked the engineer, but what was said before his appearance was not recorded.

* * *

There are 63 distinct varieties of canaries to be exhibited this year at the Canadian National Exhibition, 31 different breeds of rabbits and 24 cavies.

There will be 21 sections for field grain this year at the Canadian National Exhibition, five for grain in sheaves, and a similar number for grain in sacks.

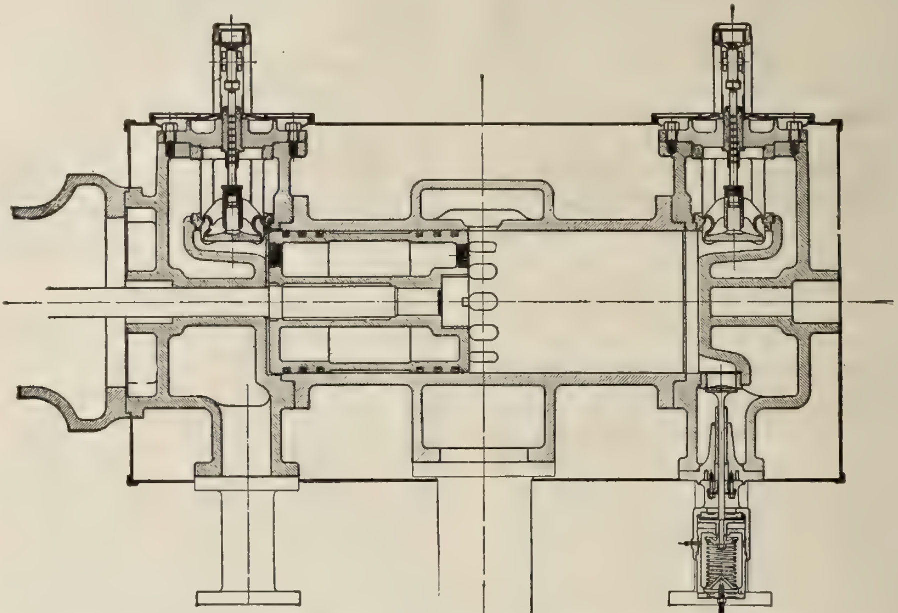
PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

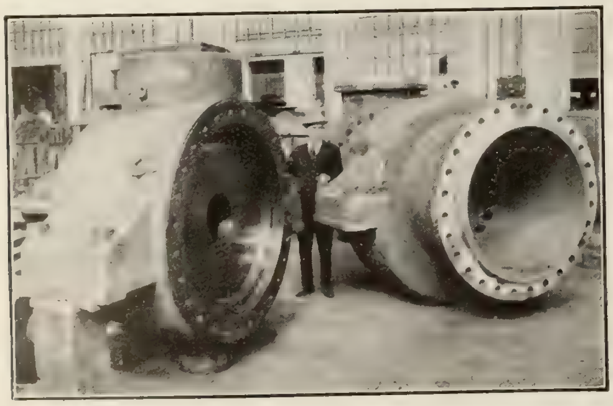
UNIFLOW ENGINES FOR DRIVING ROD MILLS.

THE merits of the uniform type of steam engine are gradually compelling a wider appreciation of its capabilities. In the struggle for efficiency in power production, attention has been chiefly centred on the steam economy of this engine with a consequent lack of appreciation in regard to its conspicuous ability in another direction, viz. overload efficiency.

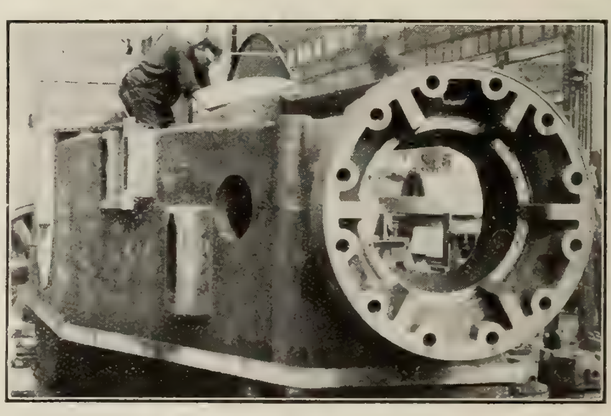
Without detracting from its increased general efficiency, one of the most desirable features of the uniflow engine is its capacity for extreme overloads with a flat steam consumption curve, tests having shown that 200 per cent. load can be carried with an increase in steam consumption of only 10 per cent. Such a fact renders this type of engine well adapted for fluctuating loads with high peaks such as rolling mills and electric stations.



CROSS-SECTION OF UNIFLOW TYPE OF CYLINDER SHOWING CENTRALLY LOCATED EXHAUST PORTS.



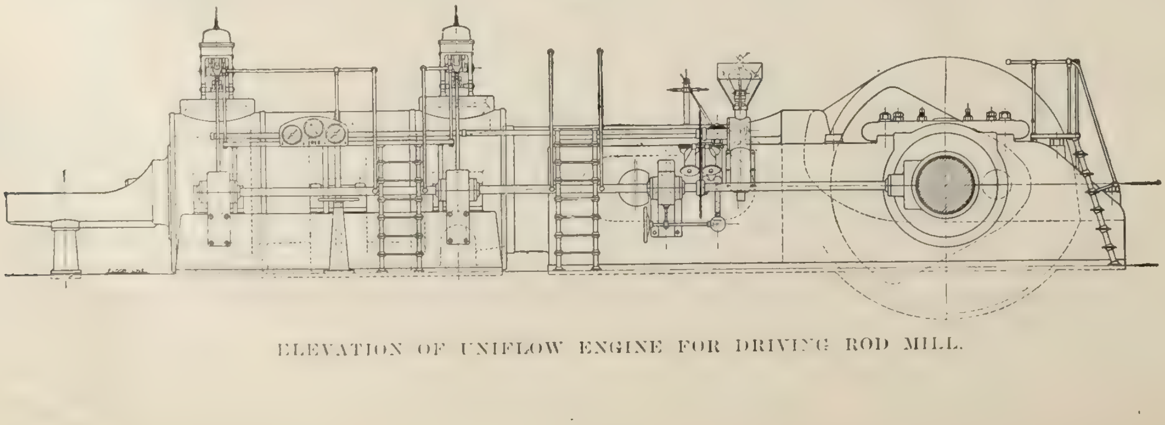
CYLINDER HEAD AND CYLINDER FOR 44-IN. DIA. BY 50-IN. STROKE UNIFLOW ENGINE.



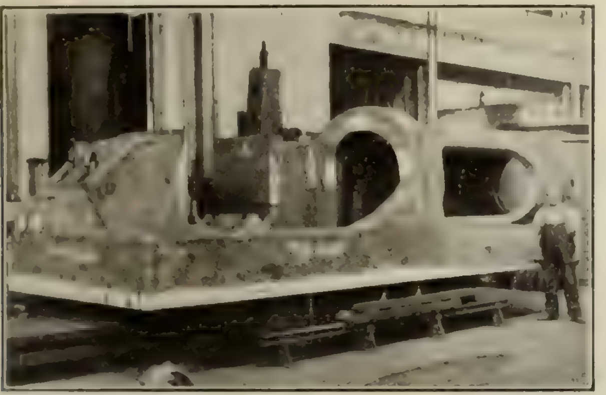
END VIEW OF FRAME SHOWING REINFORCEMENTS ON FLANGE WHICH CONNECTS TO CYLINDER PARTS.

The first applications of this type of engine to rolling mill service in America have just been carried out by the Nordberg Manufacturing Company, Milwaukee, Wis., for the Youngstown Sheet & Tube Company, Youngstown, O. Two engines have been completed and shipped, the larger one to drive a 12 in. rod mill, and the smaller a 9 in. rod mill, the accompanying illustrations showing the principle of operation and some of the larger parts in course of construction.

The general design of the cylinders is shown in the cross-sectional drawing which illustrates clearly the distinguishing features of the design. Live steam is supplied to the interior of the two cylinder heads, which are duplicates in regard to general arrangement of passages, valves, etc. The cylinder proper



ELEVATION OF UNIFLOW ENGINE FOR DRIVING ROD MILL.



BED OF 44-IN. DIA. BY 50-IN. STROKE UNIFLOW ENGINE BEING MACHINED.

is of plain tubular form having cast around its centre portion an annular passage, into which the exhaust steam from either end of the cylinder alternately escapes as the piston uncovers in turn a number of ports in the cylinder wall. The piston is of considerable length being not quite equal to the stroke, and is provided with rings at either end.

The steam admission valves are of the double beat poppet type, and are operated from a hay shaft by a releasing valve gear with spring dashpots, the cut-off being under control of the governor through the wide range of loads. As the only means of exhaust is through the ports referred to, the steam flows in one direction only, hence the name uniflow, consequently the ends of the cylinder are not cooled by the rush of exhausting steam which takes place at the point farthest from the ends. The temperature of the various parts, therefore, although it varies from the heads to the centre, is constant, and thereby renders the engine suited for a high ratio of expansion. Steam may be expanded from boiler pressure down to condenser pressure in one stroke, the steam economy of a single cylinder engine being equal to that of a modern compound engine.

Relief valves connect the interior of the cylinder with the live steam space so that should an excess amount of steam remain in the cylinder due to loss of vacuum from any cause, the pressure resulting from this being compressed by the piston on the return stroke will force the steam back into the steam space without damage. These valves are on the lower side of the heads, and are of the poppet type fitted with a cataract dampening device. A feature of the valves is the absence of packing on the value stems, which are accurately ground and lapped bushings.

The frame as will be observed from the illustrations, is of the horizontal Tangye type, with side crank and flywheel. Heavy duty requirements are met throughout the design, the general specifications and principal sizes of the two engines being as follows:—

	Large Engine	Small Engine
Brake horsepwore at 20-in. vacuum:		
Average	1,400	600
Maximum	2,100	1,600
Speed, r.p.m.	65-110	75-100
Diameter of cylinder, in	44	37
Stroke, in.	50	48
Shipping weight, lb.	480,000	360,000
Weight of frame, lb.	108,085	74,340
Weight of cylinder, lb.	19,005	......
Weight of front cylinder head, lb.	14,240	......
Weight of rear cylinder head, lb.	14,155	......
Normal steam pressure, lb.	170	170
Normal superheat, deg. Fahr.	75	75
Maximum steam pressure, lb.	200	200
Maximum superheat, deg. Fahr.	100	100
Diameter of main and outboard bearings, in	25	20
Length of main and outboard bearings, in	40	36

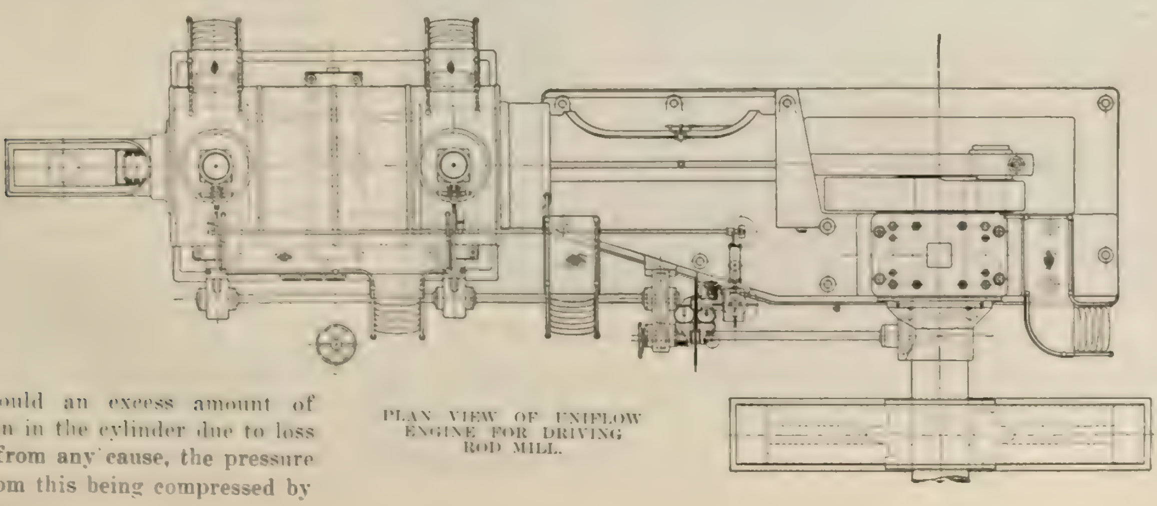
Diameter of flywheel, ft.	16	10
Weight of flywheel, lb.	110,000	90,000

POLISHING LATHE WITH PUSH-BUTTON CONTROL.



PLAN VIEW OF UNIFLOW ENGINE FOR DRIVING ROD MILL.

POLISHING LATHE WITH PUSH BUTTON CONTROL

THE adoption of push-button control and the provision of individual locking devices for each spindle are among the principal features of a new design of motor-driven polishing and buffing lathe developed by the Gardner Machine Co., Beloit, Wis. The control panel is arranged on the front of the machine as illustrated on page 183, the starting button on the right being sunk below the surface of the panel so as to eliminate any possibility of accidental starting. Further safety is provided by a simple device which locks the stopping button at the left of the panel.

The machine is built in several sizes, for either direct or alternating current, the motors used being fully enclosed so as to be proof against dirt and dust. Internal cooling of the motor is provided by a fan on the shaft, inside of the right hand cover, air being drawn from the base at this end, and discharged downward through the other end, thus obtaining a circulation of air which prevents the motor overheating under normal conditions.

When direct current motors are used, an adjustable speed range is available, the desired speed being obtained by moving a lever within the base. When using alternating current the speed adjustment is not so great as certain speeds only are available.

The spindles are locked, when changing wheels, by means of plunger pins mounted on the ends of the motor casing. These pins are normally held free by springs, and when in use are inserted into any one of four holes spaced around the collars seen in the photo, being locked in position by thumbscrews while changing wheels. Ball bearings are used on the armature shaft, suitable end frames being used for this purpose.

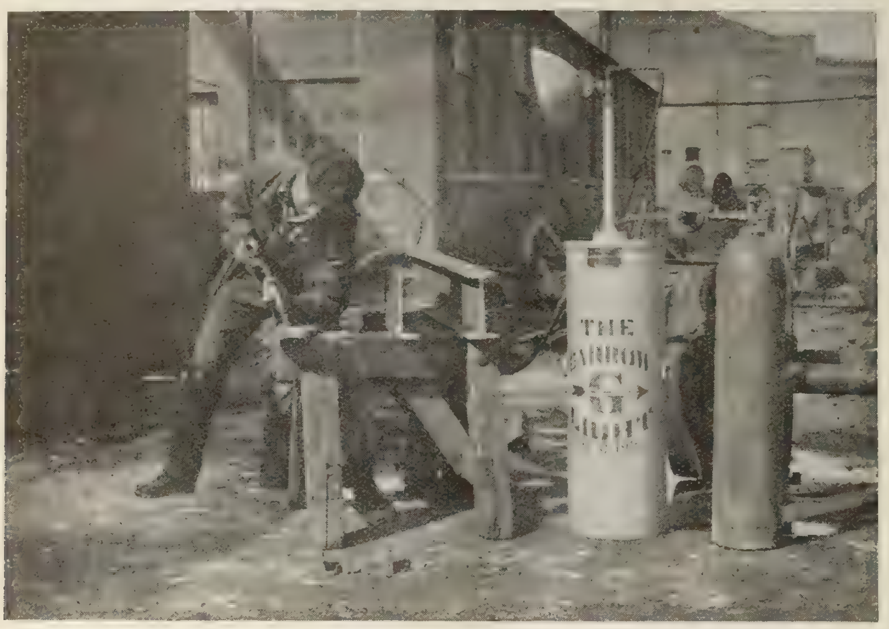


FIG. 1 PORTABLE LIGHT AND ACETYLENE GENERATOR

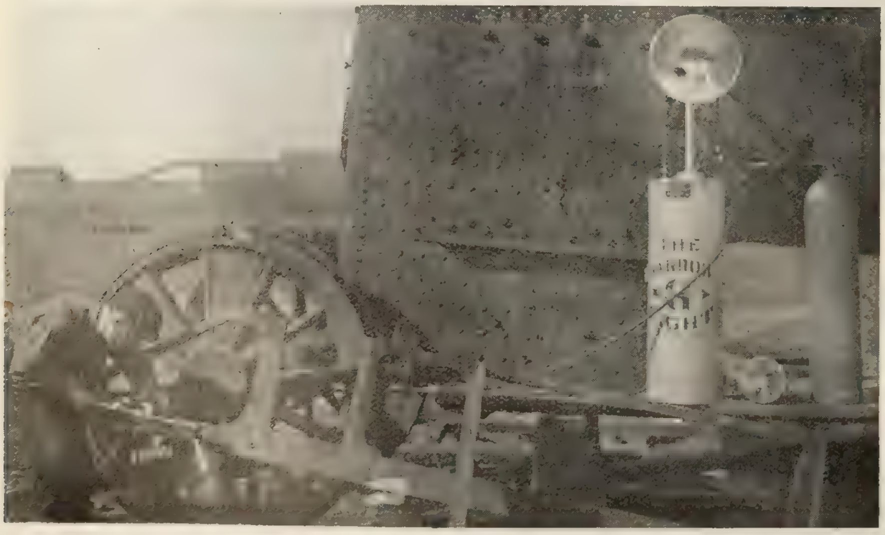

FIG. 2 PORTABLE LIGHT AND ACETYLENE GENERATOR

PORTABLE LIGHT AND ACETYLENE GENERATOR.

THE Garrow light recently put on the market by The Canadian Fairbanks-Morse Co., is designed to meet the requirements of contractors, miners, and others for a portable acetylene flare light of high candle power. This light is also suitable for use as a generator for cutting and welding by the oxy-acetylene process. The outfit consists of a Garrow Light, a tank of oxygen and a "low-pressure" welding or cutting torch. Fig. 1 shows several structural steel shapes that were cut in an average time of one minute and Fig. 2 shows the cutting up of a locomotive. The tire and main frame were cut in less than two minutes and the 7½ inch steel shaft shown between the light and the oxygen bottle was cut completely through in seven minutes. Welding may be done at proportional speeds, while an advantage of the outfit is that an 8000 candle power light is available at all times when the work is being done in dark or confined places.

The apparatus as illustrated weighs 70 lbs. and uses 9 lbs. of carbide at a charge. This provides 50 cu. ft. of acetylene gas at a cost of about ½ cent per cu. ft. The light can be recharged in two minutes, and has a patented by-pass that burns any excess gas produced, obviating all danger or smell of escaping gas.

PAT. MAY 7, 1907 OTHER PATS PENDING. RUB-STEEL VALVE

RUBBER AND STEEL VALVE.

❖

COMBINATION RUBBER AND STEEL VALVE.

THE use of a special process by which rubber is securely and lastingly attached to steel enables the makers of the Rub-Steel valve to produce a valve which resists warping and twisting under high pressures, and possesses the desirable seating qualities of a rubber surface.

The construction consists of a plate of high-grade steel placed in the centre of the valve with a tough rubber composition on each side and edge. Because of the rigidity of form thus obtained, the surface of the valve retains its true normal position, and is not forced through the grating by high pressure. Its reduced thickness gives greater efficiency to the pump, and when pumping hot water, a softer valve may be used, thus securing a better seat on worn or uneven grids.

These valves are manufactured exclusively by Voorhees Rubber Mfg. Co., Jersey City, in four different grades covering all ordinary conditions as well as extra high temperatures, and condenser service. Canadian Fairbanks-Morse are Dominion agents.

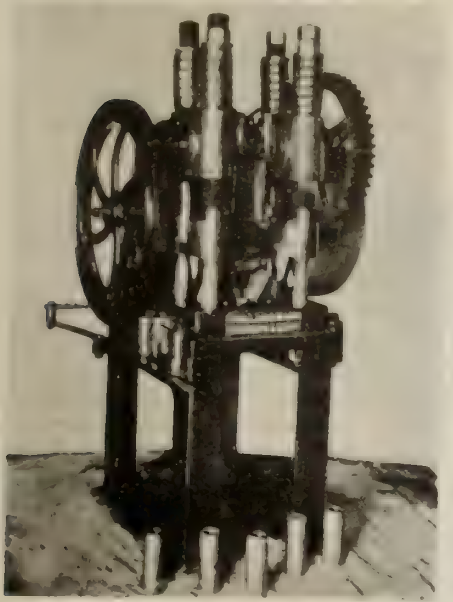
SHELL BANDING PRESS

A SHELL banding press possessing interesting features of construction has been developed by Pullan & Mann, Leeds, Eng. The accompanying illustration shows the essential features of the machine which is operated mechanically on the lines of an ordinary power press, with eccentric rod and crosshead. The eccentric shaft is carried in bearings cast integral with the main frame and is driven through heavy spur gearing from the pinion shaft which extends across the frame, one end carrying the tight and loose pulleys and the other a suitable flywheel.



SHELL BANDING PRESS.

The dies which compress the band are three in number, two being mounted on the base plate and the third being fastened to the crosshead, which is moved up and down by the eccentric rod and is guided by four tie rods as shown. At the upper ends of the tie rods are mounted four heavy coil springs which receive the upward thrust from the eccentric rod, the main frame being flexibly connected to the base plate to allow of a slight upward movement when the compression on the band reaches a maximum.

Spring tension is adjusted by lock nuts on top of the rods, while the position of the upper die at the lower end of stroke is adjusted by lock nuts on the outer pair of the rods below the eccentric shaft bearings. A belt shipper handle is provided at the left side of the machine which delivers a number of blows on the band, the shell being turned around to distribute the pressure.

* * *

CORE MAKING MACHINE FOR GENERAL WORK

THE core making machine shown in the accompanying illustration is capable of making cores from 1 in. to 14 in. long, and will fill boxes using 200 cu. in. of sand. The sand is supplied by an elevating and feeding device by means of which the supply of sand is regulated to suit the core being made.

Compressed air is used for supplying the sand to the core boxes, which are filled at the rate of eight per minute regardless of the size of core in each box, the number of cores contained in any one box being limited by the size of box which the operator can handle at the speed of the machine. Surplus air escapes from the core immediately after the box is filled, leaving the core porous, firm, and strong. The presence of air in the sand when being compressed provides a natural vent for the gases to escape by when the casting is poured.

Cores may be made of sharp sand, loam sand or green sand, using any satisfactory binder except excessive flour. The air pressure required for sharp sand cores is from 80 to 90 lbs. per sq. in. and with loam sand, 100 to 115 lbs. per sq. in. The core box is automatically clamped in position to receive the charge of sand, as also the sealing of the ends and the clamping of the box together sidewise.

The mechanical operation of the machine requires about one horse-power, while approximately 12 cu. ft. of free air are necessary for the pneumatic operation. Its use is not confined to straight cores, but includes all general work of specialty manufacturers also.

The builders of this machine are Wm. Demmler & Bros., Kewanee, Ill.

BIG INCREASE IN TRADE

AN increase of nearly half a billion in the total trade of Canada is indicated by preliminary trade figures covering the 12 months ending with May last which have been issued by the Trade and Commerce Department. The total was $1,563,230,513.

As regards exports, the total this year was $820,000,000 as against $432,000,000 in 1915, and $358,000,000 in 1913. The greatest increase is in the export of manufactured goods, which has risen from $54,000,000 in 1915, to $261,000,000. Agricultural produce rose from $45,000,000 to $107,000,000; mine products from $57,000,000 to $68,000,000, fisheries from $16,000,000 to $23,000,000, products of the forest from $43,000,000 to $52,000,000.

The greatest increase has been in exports to Great Britain, mostly of war supplies, the total being $518,000,000, as compared with $180,000,000. However, that this prosperity is not all war-produced is evident from the fact that exports to the United States also increased from $167,000,000 to $337,000,000. There was also an increase to France from $3,000,000 to $37,000,000.

There was a decrease in imports, those of dutiable goods dropping from $447,000,000 the year before the war to $321,000,000, the chief decrease being in imports from Great Britain, which fell off from $143,000,000 before the war to $86,000,000.

* * *

As early as 1882 a State deputation from Ohio visited the Canadian National Exhibition looking for pointers and they have been coming from various States ever since, many of the United States fairs being modelled along Toronto lines.

Legislation was once threatened to prevent Toronto holding an Exhibition except in years specified by the Ontario Government. Fortunately, the matter never reached the House.

OUR MUNITIONS PRODUCTION SHORTAGE—WHY?

OFFICIAL intimation has been made that munitions production in Canada has developed an unhealthy tendency. In a word, the output of shell parts is away below what it should be, and therefore scheduled shipments of completed shells—large and small—are not being maintained. The unfortunate situation may be said to arise from a variety of causes, each contributing its quota, and all, of course, bearing towards the undesirable. Raw and semi-finished materials entering into the manufacture of shells, labor shortage, and prices current which Canadian manufacturers receive, constitute, we believe, the main directions in which to seek the remedy.

In the matter of steel, the contracts already placed and those awaiting disposal among our shell-forging and machining plants surpass the capacity of our steel mills to produce on schedule, with the result that we are more or less dependent on U.S. steel mills to make good the shortage. These, of course, as is well known are also taxed to capacity to meet not only the munitions demands of their own forging and machining plants and the direct requirements of the Allied Nations, but those of a domestic nature in addition. To say that fancy prices are being realized for munitions material by the steel mills is quite a mild way of expressing oneself.

Male and Female Labor Problems

Regarding labor shortage and possible labor inefficiency both may be said to be existent, and the former possessive of a tendency to still further acuteness. While recruiting for overseas service has denuded our metal-working plants of a large proportion of what may be termed their regular employees, it has at the same time made replacement and augmentation a problem of considerable magnitude, the double contingency appearing at a time when the opportunities for forging and machining plant capacity outputs are without parallel.

The introduction of female labor is being sought as the remedy, both with the idea of filling the places of men who have enlisted and of making possible in due time the enlistment of other eligible men. In a number of plants this dilution of labor, as it is called, is already in practice, and not only are great things expected of it, but a tendency to something like rampant enthusiasm is abroad to foster it, especially by the executives of Women's Societies and Associations. A disposition is apparent as a result to find fault with and criticize our metal-working plant administrations for their caution, shall we say, in ushering in and developing the scheme. The place and part that women are taking in munitions manufacture in Great Britain are being given the necessary prominence by way of making the appeal to our plant managements of the greatest possible effect; unfortunately, however, for those making the appeal a limited knowledge of the circumstances there and here is at best available.

Plant Adaptation to Female Labor

There are, we believe, no Canadian manufacturers of munitions but would welcome the assistance of female labor. Their plants are, however, in the great majority of cases wholly unsuited for the purpose, and just here it should be noted that women munitions workers are most largely employed in Great Britain in specially designed and equipped national factories, the origin and establishment of which has been a wartime development. Canadian munitions manufacturers are face to face with the problem of erecting and equipping either wholly new plants or of making extensive and expensive additions to those already existing, and just to what length and under what circumstances they are prepared to commit themselves, brimful even of patriotism as they have proved themselves to be, outsiders may not judge.

As to our reference to labor inefficiency, such a condition has in some measure contributed to the falling off in output, particularly in the steel mill and forging departments. Here, however, perhaps extenuating circumstances may justly be pleaded, as more or less continuous tropical weather has been quite generally experienced in recent weeks. Under any weather circumstances, the men engaged in the departments indicated, no matter how exemplary the provision for their welfare, may be said to be highly susceptible to at least a temporary relaxation of effort.

Munitions Contract Prices

The prices current which Canadian manufacturers receive for shell parts, shell forgings, shell machining, etc., are, we believe, contributing quite as much as anything else to our diminished output. In the early days of shell-making in Canada, fabulous and extravagant prices were reckoned to have been paid our forging and machining plants. It looks as though we had now gone to the opposite extreme. Dissatisfaction exists, we understand, with the prices at which shell machining, shell forging, and shell part contracts are now being let, all the way down from the largest to the smallest, and so much so as to breed indifference regarding acceptance of orders. This war is to be won in our steel mills, in our forges and in our machine shops, and a price has got to be paid. The men who manage our plants are men of business and realize that as the successful conclusion of this war is now a business enterprise, it must needs be conducted according to the ethics of sound business. In a word, to do their part and sustain it to the bitter end, the prices paid must be commensurate with the manufacturing feature of the task.

Reverting to the employment of female labor in our metal-working plants, the solution is right up to the Imperial Munitions Board if Great Britain's achievement is to be emulated. The prices current for shells and shell parts for production in Canada are also due to receive the Board's immediate attention.

INDUSTRIAL NOTABILITIES

PERCY C. BROOKS, vice-president in charge of manufacturing, the Canadian Fairbanks-Morse Co., Toronto, was born at Memphis, Tenn., March 24th, 1872, the son of Edward W. and Eliza (Ralston) Brooks. He was educated at the Military Academy, the University of Georgia, and at the Georgia School of Technology. His engineering career began in 1892, and, six years later, in 1898, he became associated with the Fairbanks-Morse Co. as assistant to the president at Beloit, Wis. In 1906 he was appointed general manager at Toronto, and in 1910 was made vice-president of the Canadian enterprise.

PERCY C. BROOKS

Mr. Brooks married Edith King, daughter of Henry King, of New York City, on February 14, 1914, the family consisting of one daughter. His clubs are Lambton Golf, R.C.Y.C., Economics, Hartley Bay Hunting and Fishing; his societies, the A.F. & A.M., and his recreations, golf, fishing and shooting. In politics Mr. Brooks is Conservative and in religion a Presbyterian. His residence is Parkview Mansions, Toronto.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Aug. 14, 1916.—The general trend of our industrial activity is much the same as a week ago. Production (in many lines) which was affected owing to the extreme heat of the past few weeks, is gradually assuming more normal conditions and outputs are regaining the standard being maintained immediately previous. It is however, not expected to reach its high point for some time yet, as the holiday season is still on. Encouraging reports continue to arrive of crop conditions in all parts of the country, and railroads have been active in making preparations to handle the grain and in securing the help necessary to harvest the same. The steel situation is showing signs of improvement, and some lines are beginning to strengthen. Ship-building is active but handicapped for lack of steel plates and other necessary material.

Steel

The long period of steadiness, which has prevailed in steel for a couple of months, is showing signs of breaking, but in an upward direction. Indications point to a number of advances, the market undoubtedly gaining strength, and some lines already showing increases. There is no abatement in demand and the mills are still heavily taxed to meet requirements. Foreign inquiries for billets and bars are relatively heavy, and an apparent shortage for prompt delivery has developed, with a corresponding stiffening of the market. In some cases consumers are meeting the situation by using first class shell steel discards. Pittsburg quotations on open hearth steel have been advanced $2 a ton. A similar advance has been, by some producers, placed on structural material. The situation in plates is becoming tighter and an advance of $2 per ton went into effect on Aug. 4. Sheets are fairly active, the demand for blue annealed being good. Owing to the condition of the spelter market, it is expected that galvanized sheets will weaken, but no change has as yet developed. This is due to the fact that the recent collapse in spelter has not yet reached the sheet product; however, unless a firmer tone is soon shown declines are looked for. Even should spelter become stronger, some slight decline in galvanized sheets is not unlikely. Inquiries for wire and wire products show an improvement, an advance of $2 being recently put into effect on the American market. Local dealers however, in the expectation of a stronger market are holding prices firm. The demand for boiler tubes, is taxing the capacity of many mills, bookings in some cases being as much as a year in advance. The local situation is unchanged, but dealers are expecting to revise some of their lists.

Machine Tools and Supplies

The general situation throughout the machine tool industry has shown little change. The activity recently developed by the demand for the larger tools, required for the manufacture of the heavier shells has apparently passed its maximum and indications point to a gradual decline from now on. However, a fair amount of business is still passing. Considerable interest is being shown in the domestic demand, which has grown to a very encouraging volume. The requirements of the trade still call for large quantities of machine tool accessories and supplies. The situation in this respect is however, not as tense as a few month ago, and delivery on all needed equipment is more prompt, in many instances prices are also easier.

No great change has taken place in the metal situation. Increased activity has given a better tone to copper. Tin is quiet and unsettled. Spelter is weaker in an indifferent market. Antimony continues dull, with prices easier.

Copper.—Increased activity is noted in the copper situation and higher prices are expected. Negotiations for large supplies of copper by the British Government have been concluded, and it is expected the quantity of metal under contract will be about 150,000 tons, delivery to extend throughout all next year. It is also certain that other Allied Governments have been buying heavy. The trend of the market with prospects of a further advance has created an additional demand from domestic consumers, the buying movement as a result being more general. The increase in the volume of war orders has necessitated manufacturers covering their copper requirements. The demands being made upon producers for early delivery are very heavy, and it is almost impossible for the refineries to fill orders for short period shipment. With the total disappearance of second-hand metal and the existing high pressure it is more than likely that quotations will show further advances. London reports a very strong market, with prices going up. Standard spot is quoted at £117 10s., being an advance of £5 10s. during the week. Futures have advanced a similar amount, and are quoted at £109 10s. Electro spot at £124 shows an advance of £1 per ton. New York market is active, with prices advancing. Prime lake is ⅛c stronger, and is quoted at 26½c; electrolytic is firm at 27c, but is expected to become stronger. Dealers here report a little increased activity, with prices holding firm at 31c for lake and electrolytic, and 30c for castings.

Tin.—The market at present is a little unsettled, due to increased difficulty in obtaining shipping permits. This is causing a little uneasiness among American buyers, and the tone of the market is a shade stronger. If excessive buying should develop it is anticipated that tin will advance. Prices on futures are hard to obtain, as sellers are dubious of quoting under present market figures. Recent advances on the London market denote a rising tendency, a £3 10s. advance on standard spot and futures, and £3 on Straits spot having placed the current prices at £171, £172 and £171.10s. respectively. New York reports an advance of .825 cents per pound, the quotation being 38⅝c. Dealers here report a steady market at last week's price of 43c per pound.

Spelter.—A revival in the foreign demand for spelter, which resulted in considerable buying, has placed the market in a somewhat unsettled condition, and domestic consumers are showing a little uneasiness as regards the situation.

Owing to the relapse recently experienced, both galvanized and brass interests have been fairly heavy buyers, and the requirements of the markets abroad, if heavy, may result in a stronger market, with a corresponding increase in price. Just what the exact position is at present is difficult to say, as the movement now on may prove to be of short duration, like that of a few weeks ago. It is safe to say that producers are not over-exerting themselves in stocking the market at present prices, as in some instances, small producers can make little or no profit under existing conditions. A slightly stronger market in London has resulted in an advance of £2 on spot and £1 on futures, the latest quotations being £49 and £43 respectively. New York, however, while apparently active, has declined to 8.675 cents, a drop of ⅛c per pound. The local situation is unchanged, with prices firm at 14c per pound.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Lead.—The decline recently noted in the price of lead has not resulted in a very heavy demand, as was anticipated, although considerable buying has been reported. Consumers are under the impression that lead will be still lower. It is understood that while both the Trust and outside interests were nominally on the same basis, sales were made by the latter at a lower figure. It is, however, generally believed that the independents will again return to the basis of the Trust price. London reports a better demand and quotations show a slight advance—15 shillings on spot and 12 shillings on futures, or a basis of £29/5 £28/12½ respectively. The nominal price on the New York market remains firm at 6c. Local dealers are quoting 8¼c on a fairly steady market.

Antimony.—The market continues to weaken, despite the fact that buying has recently shown a little improvement. Holders of metal are apparently anxious to dispose of it even at a loss, as quite a number have considerable stock on hand, for which they paid almost double the price they can get for it now. New York quotations have again declined 2c, being quoted at 10½c per pound. Dealers here are asking 15c on a very weak market, a decline of 1c per pound.

Aluminum.—The situation is unchanged, and prices are firm at 68c per pound.

Scrap

Few developments have taken place in the scrap situation. The strength being shown in the steel market is not yet re-

Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department is able to present the following list of the moreimportant British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

BRAZIL

Bahia, British Consul.
Rio de Janeiro, British Consul General.

CHILE

Valparaiso, British Consul General.

COLOMBIA

Bagota, British Consul General.

ECUADOR

Quito, British Consul General.

EGYPT

Alexandria, British Consul General.

FRANCE

Havre, British Consul General.
Marseilles, British Consul General.

INDIA

Calcutta, Director General of Commercial Intelligence.

ITALY

Genoa, British Consul General.
Milan, British Consul.

MEXICO

Mexico, British Consul General.

NETHERLANDS

Amsterdam, British Consul.

PANAMA

Colon, British Consul.
Panama, British Vice-Consul.

PERU

Lima, British Vice-Consul.

PORTUGAL

Lisbon, British Consul.

RUSSIA

Moscow, British Consul General.
Petrograd, British Consul.
Vladivostock, British Consul.
Odessa, British Consul General.

SPAIN

Barcelona, British Consul General
Madrid, British Consul

SWEDEN

Stockholm, British Consul.

SWITZERLAND

Geneva, British Consul.

URUGUAY

Monte Video, British Vice-Consul.

VENEZUELA

Caracas, British Vice-Consul.

flected in old materials, and, with the exception of steel axles, which have advanced 1½c to a basis of 14½c per pound, general quotations are reported by local dealers as steady. Old copper has advanced ½c per pound, being now 15½c for light copper and 18½c for crucible, heavy and wire.

Toronto, Ont., Aug. 17.—The falling behind in the deliveries of munitions is the subject of a statement recently given out by the Imperial Munitions Board. The shortage of production is largely due to the inadequate supply of sufficiently skilled labor, which is adversely affecting not only the machine shops, but also forging plants and factories making component parts. It is absolutely essential that all those engaged in the manufacture of munitions should co-operate in order to secure an increased production of munitions. The shortage of labor is also hampering other industries. The situation in this regard is becoming acute, and no serious effort has so far been made to relieve it.

Steel

Although easier conditions in the steel trade have been predicted, there is apparently little possibility of this taking place for some months, as there are now indications of considerable firmness in the market. This is evidenced by the recent advance in the States of $2 per ton on steel bars and wire, and higher prices on billets. The increased strength in the market is further indicated by the big contract for shell steel, amounting to 500,000 tons, recently closed in the States by representatives of the Allies. No statement has been made, and perhaps will not be for some time to come, as to the extent Canadian mills will benefit by this new buying movement, but it is fair to presume that they will get as much business as they are able to take care of. Production of steel in Canada this year will no doubt beat all previous records, and will probably run into well over one million tons. What may be termed ordinary business has been exceptionally good so far this month, considering the time of the year and owing to the otherwise industrial activity. With renewed strength in the market, prices are considerably firmer, and indications point to still higher prices on some steel products. Steel and iron bars have already advanced 10c per 100 lbs., and it is fully expected that plates will be affected in the near future. Prices of boiler tubes are very firm. The demand in the primary market is very heavy and deliveries extend well over a year. Wrought iron pipe is also very firm, and the skelp situation is unchanged. Wire nails have advanced 10c per keg, and are now quoted at $3.80 per keg base.

The sheet market continues irregular, with prices firm and unchanged. The demand for blue annealed sheets in the primary market is unusually active, but black sheets are quiet. Sheet bars continue very firm, with the prospect of higher prices, while production has fallen off, due to the hot weather. The galvanized sheet market is unsettled, but quotations are unchanged.

The steel market in the United States is stronger, due to heavy export demand; domestic buying is light for the time being. The contract for shell steel which the Allies have placed in the States calls for 500,000 tons of material, and includes billets, rounds and forgings, delivery to be completed by the end of July, 1917. The prices range from $40 to $90 per ton, according to quality of the steel, making an average price of $67.50 per ton. The market is very active, and the general opinion of producers is that another buying movement has started. Many domestic consumers are said to have not covered their requirements for steel on business booked, and shell steel, plates, bars, etc., are now being sought in large quantities. These orders must eventually be placed, which will tend to strengthen the market still further. The United States Steel Corporation reports unfilled tonnage on hand on July 31 at 9,593,592 tons, a decrease of 46,800 tons, as compared with 9,640,458 tons on June 30.

Pig Iron

The situation in the pig iron market is unchanged, and the consumption of steel-making grades of iron continues exceptionally heavy. The production of pig iron in the first half of this year was 40 per cent. ahead of the production in the corresponding period of 1915, and 11 per cent. ahead of production in the last half of that year. It is predicted that the output for this year will exceed the high record of 1913.

Scrap

The market continues dull, with little of interest to note. Prices remain steady and few changes of importance have been made. Heavy smelting steel is quiet, although the demand continues heavy. Copper and brass scrap are firm and unchanged, while quotations on both lead and zinc have a weaker tendency.

Machine Tools

Interest continues to be centered on munition contracts, and a number of inquiries have been received recently by local machinery houses for tools for machining large shells. While business continues good, it is not as active as it was, the reason being, of course, that many munition plants are fully equipped. Orders being placed now are largely confined to heavy duty lathes.

Supplies

Business continues brisk and prices steady but firm. Iron, steel and brass supplies are particularly firm, and an advance in some lines is looked for. An advance has been made in some lines of hack saw blades; mounted grindstones have also advanced. Soldering coppers have declined 2c per pound. Linseed oil and turpentine are both unchanged and firm. Gasoline and benzine have declined 1c per gallon following three reductions in the States in the price of crude oil, making a total of 25c per barrel. Canadian crude has declined 5c per barrel.

Metals

With the exception of copper, the metal markets generally have been dull and weak during the past week. Business is rather quiet, which may be expected at this season of the year. The undertone in the copper market is very strong, due to heavy demand for this metal for munitions. The demand for tin continues light and prices are receding. Spelter is also weak, with a small volume of business. Lead continues weak, with the outside market now lower than the Trust price. Antimony has declined again and the market continues weak, but aluminum is unchanged. Solders have declined following the reduction in prices of lead and tin.

Copper.—Quotations continue nominal, but the market is stronger on account of increased demand. It is reported that representatives of the Allies are negotiating for a large amount of copper with the leading U. S. producers for delivery over all of next year. There is practically no spot copper to be had, and much of the production to the end of the year has been disposed of. The market has a strong undertone and higher prices are not unlikely. Local quotations are unchanged and nominal at 29c per pound.

Tin.—Although the market is higher in London, quotations in New York are unchanged; the market, however, is weak. Large sellers are not pressing metal on the market, while consumers are not displaying much interest in tin. Local quotations are lower at 43c per pound.

Spelter.—The market continues weak, with light demand. Galvanizing interests have been buying fairly freely. Spelter has declined locally, and is now quoted at 12½ per pound.

Lead.—Business has been quiet, notwithstanding the recent reduction in price by the Trust to 6c, New York. The outside market is a shade lower, but there is some possibility of a reaction. Lead quotations are unchanged at 8¼c per pound.

Antimony.—Prices are still nominal, and the market continues weak. Antimony has declined 3c locally, and is now quoted at 16c per pound.

Aluminum.—The market is quiet but

firm, with quotations unchanged at 68c per pound.

Solders.—Quotations have declined 1c per lb. following the lower prices on lead and tin. Guaranteed is quoted at 27½c, and strictly at 25½c per pound.

◆

LACHINE CANAL TRAFFIC IN JULY

ALTHOUGH the ten days that the Lachine Canal was practically closed to navigation and the water-borne stream of freight entering and issuing from Montreal, thereby interrupted, the totals for the month of July are nevertheless interesting in that they show certain changes in the tendencies of trade. For example, the 1,589,432 bushels of wheat brought down through the canal during last month only lack 283,235 bushels of reaching the total for July in 1915, and this is the more noticeable in that so far this year the monthly totals have been almost half of those for 1915. If there had been no hiatus in the daily receipts, it is believed that July's total this year would have exceeded the same month in 1915 very decidedly.

Grain, Produce, Coal

The total grain received last month was 3,381,363 bushels, an increase of 122,503 bushels. The delay caused by the trouble in the Lachine Canal will show its effect more in August than in July as the boats which were delayed did discharge their cargoes in July, but they will be later in their next return trip. In addition to wheat the only grain to show a decrease for July was barley, 306,196 bushels having come down the canal, as against 391,906 bushels for the same month a year ago. Other grains showed increases as follows: Corn, 340,853 bushels, against nothing for July, 1915; oats, 948,152 bushels, an increase of 66,730; rye, 81,000, an increase of 57,865 bushels; and flaxseed, 49,000 bushels, an increase of 26,000.

For the whole season to date, however, 1916 falls 8,992,839 bushels short of 1915 in the total amount of grain brought down, the figures being 11,920,617 bushels and 20,913,456 bushels.

In produce the only increase shown is in the total of 1,073 packages of butter, as against 1,049 for July, 1915. Other statistics in this department for last month are as follows: Flour, no sacks, as compared with 1,400 a year ago; eggs, 1,785 cases, 485 cases less than in July, 1915; cheese, 42,097 boxes, a decrease of 1,247 boxes.

Coal still maintains its lead, the 220,042 tons brought down last month being 34,427 tons in excess of the figures a year before last month.

Vessel Trips and Passengers Carried

Other statistics of interest follow for the months of July in 1915 and 1916 respectively: Trips, 1,143 and 1,094, decrease 49; tonnage operated, 593,509 and 582,015, decrease 11,494; passengers carried, 22,656 and 22,299, decrease 357; cargo tonnage, 452,033 and 471,061, increase 19,029; light trips, 379 and 357, decrease 22. When it is considered that the warm weather during the time the canal was closed was ideal for the Rapids trip, it is evident that last month showed up better for passengers than July in 1915 in spite of the slight decrease.

From 1858 until 1878 the Toronto Fair was held in the old Asylum grounds on King Street West.

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

CANADIAN TRADE COMMISSIONERS.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Brockville, Ont.—The Canadian Briscoe Motor Car Co., will build an addition to their plant here.

Sherbrooke, Que. — The Canadian Ingersoll-Rand Co., will build a large addition to their machine shop.

Welland, Ont.—The Canadian Steel Foundries, Ltd., will build a forge shop at their plant here to cost about $6,000.

Welland. Ont.—The Electro Steel & Metals, Ltd., will build an extension to the foundry at a cost of about $10,000.

Brantford, Ont. — Another important industry, the Dominion Steel Products Co., is now practically assured for Brantford. The City Council, at a special meeting on Aug. 10, granted the company a fixed assessment of $10,000, to run fourteen years. They will locate in Holmedale, where options have been secured on suitable available property. The Company propose erecting a factory to cost about $50,000.

Municipal

Lyall, Man.—The Town Council will construct an electric light and power plant at a cost of $8,000.

London, Ont.—The City Council will call tenders for a number of pumping units for the waterworks system.

St. Mary's, Ont.—The Town Council are considering the advisability of installing a septic tank sewage disposal system at a cost of $15,000.

London, Ont.—The City Council are considering the installation of a water wheel, electrical generator and 250-h.p. pump for the waterworks. Estimated cost, $15,000. General Manager, E. V. Buchanan.

Toronto, Ont. — The York Township Council contemplate extensions to the water distribution system. The engineer Frank Barber has been instructed to prepare plans for 24 in.. and 12 in. water mains.

Watford, Ont.—A bylaw to issue $10,000 in debentures to pay for the installation of a hydro system here carried almost unanimously on Aug. 1. Construction of a line will be commenced at once.

Hamilton, Ont.—The City Council has voted in favor of improving the waterworks system and will send a special delegation to other cities with a view to ascertaining the best means of accomplishing this end.

Hamilton, Ont.—The recommendation of the Works Committee that a 20-in. water main be constructed on Main Street at a cost of $11,468, has been adopted and the Board of Control instructed to purchase the necessary right-of-way.

Hamilton, Ont.—A gas expert at a cost not to exceed $3,000 will be engaged to come here and go over the gas fields from which Hamilton's supply is obtained and report on the possibility of a supply in the future, and on the advisability of increasing same by the addition of coke gas.

General Industrial

Sarnia, Ont.—An American concern contemplate establishing a dye works here.

Walkerton, Ont.—The Canada Spool & Bobbin Co., is having plans prepared for an addition to its plant which will increase its capacity over 50 per cent.

Trade Gossip

The International Engineering Co., Amherst, N.S., have sold two 600 h.p. water tube boilers to the Goodyear Tire & Rubber Co. for their plant at New Toronto, Ont.

Niagara Falls, Ont.—Mrs. Thompson, wife of J. Enoch Thompson, Spanish Consul at Toronto, opened the aerial tramway over the Whirlpool, constructed by the Niagara Spanish Aerocar Co., on August 8.

Canadian Vickers Co.—The London Times understands arrangements are being made for an issue of a million pounds sterling 6 per cent. debentures on behalf of Canadian Vickers Co. It is believed the issue will be redeemable by a sinking fund during a period of twenty years.

Business for Canada.—It is reported from London, England that Canadian Trade Commission which has been conducting a campaign in the interests of Canadian business, has carried out its mission most successfully. It was announced to-day that 1,700 forms have been filled in by British manufacturers and merchants who pledged themselves to purchase from and sell to Canadian houses the goods which were formerly purchased from and sold to enemy countries.

Ontario Steel Products.—The retiring board of directors of Ontario Steel Products was re-elected at the annual meeting, held recently at Gananoque, Ont. The board is as follows:—W. Wallace Jones, Toronto; Dr. N. C. Jones, Toronto; J. T. Richardson, Toronto; W. T. Sampson, Gananoque; D. Ford Jones, Gananoque; F. P. Jones, Montreal; F. Bacon, Montreal; Kenneth Nelson, Montreal; W. M. Byers, Gananoque. The officers are—President, W. Wallace Jones; vice-president and general manager, W. T. Sampson; secretary-treasurer, F. Petch.

Huge Steel Contracts.—It is reported from New York that contracts calling for 500,000 tons of shell steel, and valued at $34,000,000 were closed on August 11, between representatives of the Allies and the United States Steel Corporation, acting with several large independent companies. This business is the largest steel contract placed since the war began. The order includes semi-finished (billets), rounds and forgings, and delivery is to be completed by the end of July, 1917. The material will be used abroad in the manufacture of high explosive shells.

Oil-bearing Shales.—A proposal has been submitted to the Dominion Government asking that it encourage the development of the oil-bearing shales, of which there are known to be large deposits in New Brunswick, in parts of Saskatchewan and Alberta, and to some extent also in British Columbia. These shales exist not only in commercial quantities, but the resources are so rich as to provide for a considerable part of Canadian requirements, according to Louis Simpson, of Ottawa, who has made an exhaustive study of the subject. It is hoped by this means to reduce the price of gasoline.

Big Copper Purchase.—It is reported from New York that manufacturers supplying the Allies with munitions are negotiating for the largest copper purchase ever made in the United States. The amount required will be 250 million

28-in. Conradson Band Turning Engine Lathe

Strength. See the manner in which the head stock is cast integral with the bed? Compare that with the usual bolted construction. Two massive bronze worm wheels are mounted on the spindle, driven by hardened worms with ball thrust bearings, the worms are driven by a train of heat-treated nickel schrome steel gears running in oil. The spindle thrust is taken by a massive ball thrust. The phosphor bronze bearings are of the conical sleeve type. Every feature is suggestive of strength. A look at the machine would convince you that it is strong.

THE A. R. WILLIAMS MACHINERY CO., LTD.

WE ARE NOT GOING TO GIVE YOU UP

We have a Geometric Self-Opening and Adjustable Screw-Cutting Die Head for you, and we want you to have it.

The big manufacturers are using them, and the smaller manufacturers cannot afford to do their thread cutting without them.

Geometric Self-Opening Die Heads, that release the work when the required length is reached, are furnished for cutting from 1-16-inch diameter up to the largest requirement, of any pitch and form.

Can be arranged for use on any make of Screw Machine

Let us know the line of thread cutting you have to do, and we will send you full particulars of the Die Head.

pounds about 15 per cent. of the country's entire prospective output for 1917. At present prices $70,000,000 will be involved. The agreement on prices is the only detail that is holding up the order. One of the principals in the deal is away from the city, and when he returns the order will be completed at once. This, it is expected, will be in about three weeks.

C.P.R. Tunnel Named.—At the request of Lord Shaughnessy, His Royal Highness the Duke of Connaught, Governor-General of Canada, has graciously allowed the tunnel, which the Canadian Pacific Railway bored under the Selkirk Mountains, to be named after him. The Connaught Tunnel, which is five miles long, double-tracked, gives the Canadian Pacific Railway the lowest grade of any transcontinental line through the Selkirks. His Royal Highness went through this tunnel on 17th July last, when the bore had been completed. This tunnel was bored in less than three years, and therefore, holds the world's record for tunneling. The permanent tracks are now being laid in the tunnel, and trains will be running through it very shortly.

C.P.R. Station Opened in Quebec.—At Quebec on August 10, the new C.P.R. station, the Palais, was opened under most auspicious circumstances. Nearly all Quebec turned out to witness the ceremony, and 250 specially invited guests were present at the luncheon provided in the new waiting room, which was artistically decorated for the occasion. A. D. MacTier, general manager of the Canadian Pacific, presided, and among those present were Major Lavigneur and Madame Lavigneur, Hon. T. Chase Casgrain, Hon. L. A. Taschereau, Minister of Public Works; Hon. N. Perodeau, M.L.C., and D. O. Lesperance chairman of the Quebec Harbor Commission, Dr. Reid, Minister of Customs and Acting Minister of Railways; Madame Casgrain, Sir Lomer Gouin, Premier of Quebec; Hon. J. S. Kaine, Hon. Geo. McCorkill, and F. L. Wanklyn, executive assistant of the C.P.R., etc.

Tenders

Carberry, Man.—Tenders will be received up to August 25, for the purchase of the following oil tanks and outfits: Two complete steel oil tanks, capacity 12,000 American gallons each with two pumps, piping, fittings and all connections. Apply W. D. Card.

Toronto, Ont.—Tenders for extension to Duncan Street sub-station, and addressed to Chairman, Toronto Electric Commissioners, will be received until August 30. Plans, specifications and form of tender may be obtained at the engineering offices, corner Duncan and Nelson Streets.

Ottawa, Ont.—Tenders for Incandescent Lamps, Public Buildings, Ottawa, Ont., will be received August 22. Specifications to be seen on application to Thos. A. Hastings, Clerk of Works, Postal Station "F," Toronto; to R. L. Deschamps, Overseer, Dom. Bldgs., Montreal, and to the Chief Architect, Department of Public Works, Ottawa.

Winnipeg, Man.—Tenders will be received until August 21 for the various works required in the completion of the New Parliament Buildings, and not included in the general contract. The words include structural steel, heating and ventilation, electrical conduit and wiring. Particulars may be obtained from S. C. Oxton, Deputy Minister of Public Works, Winnipeg.

Ottawa, Ont.—Tenders will be received until August 18, 1916, for the supply of filing cabinets for Dominion public buildings generally. Plans, specifications and forms of contract can be seen and forms of tender obtained on application to the office of Edwin Francis, caretaker, Post Office, London, Ont.; R. L. Deschamps, overseer of Dominion Buildings, Post Office, Montreal; Thos. A. Hastings, clerk of works, Postal Station "F," Toronto, and at the Department of Public Works, Ottawa.

Tweed, Ont.—Tenders will be received by the secretary-treasurer, High School Board, up to August 30, in whole or part, for the erection and completion of a high school building. Plans and specifications can be seen and all particulars procured at the architects' or secretary's offices. Ellis & Ellis, architects, Manning Chambers, Toronto; C. W. Huyck, secretary-treasurer, High School Board, Tweed.

Ottawa, Ont.—Tenders will be received up to August 24, for the construction of a reinforced concrete grain elevator with a capacity of 1,000,000 bushels. Plans, specifications and blank form of contract may be seen at the offices of the following: Chief Engineer, Department of Railways and Canals, Ottawa. Chief Engineer, Canadian Government Railways, Moncton Government Railways, Moncton, N.B. General Superintendent, Winnipeg, Man. Resident Engineer, Port William, Ont. John S. Metcalf Co., Engineers, Montreal, Que. Contractors who wish to obtain plans and specifications temporarily for their own use, may obtain same from any of the offices at which plans are on exhibition, on depositing a certified bank cheque in favor of the Canadian Government Railways for which will be refunded on the return of the plans and specifications.

Personal

C. T. Wimwood, who died at the home of relatives at Big Point, near Chatham, Ont., was a prominent mining engineer and mining operator. He was president of the Bisbee Copper & Development Co.

Sir George E. Foster, Minister of Trade and Commerce, sailed for Canada last Friday, on the steamer Missanabie. Previous to going on board Sir George delivered an address before the members of the Liverpool Chamber of Commerce.

Geo. A. Walkem, managing director of the Vancouver Machinery Depot, who recently left for England with the object of joining his Majesty's forces, has obtained a commission in the Royal Engineers, and has left for Egypt, where he will be stationed for the present.

William Yellowley, superintendent of the Canadian Locomotive Works, Kingston, Ont., died at his home on August 6 of heart failure, aged 57. He was a native of Newcastle, England, and had been with the locomotive works for over 15 years. Deceased was a clever inventor, and had put into operation a number of time and labor-saving devices. He devised two machines, which have materially increased the output of shells. Both are widely used in Canada, the United States and England.

Marine

Vancouver, B.C.—The Wallace Shipyard No. 1 is busy making preparations for the construction of a steel steamer for the Kishimoto Steamship Co., of Osaka, Japan.

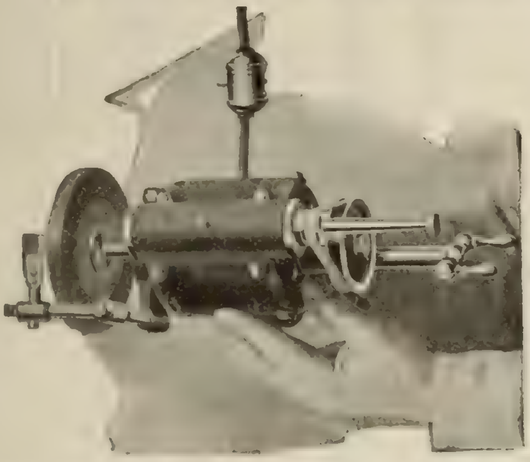
Victoria, B.C.—The keel of the first of the three ships under construction by the Cameron-Genoa Mills Shipbuilders, was laid down at the new plant on July 29. The keel is 225 feet in length over all.

Montreal, Que.—The work of strengthening by steel piles the coffer dam which has been built at the break in the weir waste of the Lachine Canal is progressing favorably and traffic has been resumed.

Vancouver, B.C.—A. Wallace, head of the Wallace Shipyards, states that the contracts had been signed for the construction of three more auxiliary schooners for the H. W. Brown Co. This makes six schooners to be built at the Wallace Yard No. 2.

The Vancouver Dredging & Salvage Co., have succeeded in floating the Japanese steamer Kenkon Maru, No. 3, which ran ashore near Mayne Island on January 12. The vessel has been placed

Aikenhead's DUMORE GRINDER



The DUMORE Portable Grinder. The only small grinder giving wheels the correct surface speed. Speed, 30,000 R. P. M.

Weighs only 17 pounds

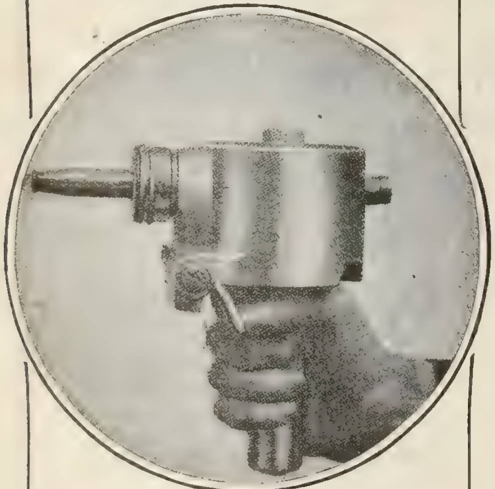
COLEMAN FARE BOX COMPANY, LTD.
70 Bond St., Toronto

The Metals Coating Co. of Canada, Ltd.
Versailles Building, 90 James St.
MONTREAL, CANADA



A machine gun making its ammunition from Reeled Wire, and coating objects by bombarding with minute plastic particles of metal. The **Schoop method** of Metallic deposition, any object and any size coated with a positive adhesive and homogeneous coating with any metal for any desired thickness.

Solves one of the greatest problems heretofore confronting the structural engineer, because it produces on iron or steel a permanent coating not susceptible to corrosion.

Carbons can be coated with copper, etc.

For full information write for booklet "D".

in drydock at Esqumalt, B. C., and will be repaired by the Victoria Machine Depot.

The Canada Steamship Lines' steamer "Moreland" is being rebuilt at Duluth, Mich. The Morland was wrecked in 1912 on Saw Tooth Reef, Lake Superior, and her stern, the only portion left intact, is being fitted to a new forward part, which will make the new steamer over 600 feet in length.

Chatham, N.B.—The trial trip of the new pilot motor schooner, Admiral Beatty, built at the Miramichi Foundry Shipyard, was held recently. The boat is 72 feet over all, has a beam of 18 ft. 4 in., and a depth of 7 ft. 6 in. She has a 50 h.p. Regal gasoline engine, and is equipped with the regular rigging of a vessel of her class. Accommodation is provided for a crew of 14 men.

Owen Sound, Ont.—The Provincial Government has purchased the small steamer Wawana and is having her converted into a motor boat with oil engines. A complete reconstruction of her deck houses is being made to afford accommodation for the officers and crew. It is expected that the power installed will make the boat the speediest craft in the lake service.

Lake Carriers' Advance Wages.—At a meeting of the directors of the Lake Carriers' Association in Cleveland, Ohio, on August 2, wages were marked up $10 a month for all men on boats below the grade of licensed officers, making a second general advance by the Association this season. An advance of 10 per cent. was made the men at the opening of the season. This action affects fully 10,000 men on the Great Lakes. The scale which was adopted is independent of the fall schedule effective in October.

A. B. MacKay of Hamilton, Ont., a well-known figure in lake shipping, has just purchased from the National Steamship Co., of Toronto, the steamer Natironco at a price not disclosed. The Natironoco is a steel vessel of about 1,600 tons dead weight capacity. She was built at Detroit in 1892, and was transferred to Canadian registry about four years ago. At present she is engaged in carrying grain and coal on the upper lakes.

Soo Canals Traffic.—Records of traffic through St. Mary's Canals were broken in July, when 14,048,404 tons of freight were carried, an increase over the previous record made in June of 1,087,935 tons; 254 more vessel passages were made, compared with July of last year. Shipments of grain showed greatest increases. In 1915 there were 2,398,662 bushels of grain, and 3,938,366 bushels of wheat. During July this year 13,349,113 bushels of grain and 31,907,803 bushels of wheat went through. Iron ore also shows increase of 2,547,023 tons over July, 1916. Of the total amount of freight, 2,629,439 tons passed through the Canadian canal, and the balance of 11,418,965 tons through the American.

Ottawa River Vessel Burned.—The pleasure steamer G. B. Greene, owned by the Upper Ottawa Improvement Co., which has plied the waters of the Upper Ottawa River for over a quarter of a century, was burned to the water's edge off her berth at Quyon on the morning of July 27. Four members of the crew, who were trapped below decks when the fire broke out, lost their lives. They are: John Stevenson, fireman, Luskville, Que.; Alcide Guertin, deckhand, Aylmer, Que.; Oscar Lapierre, deckhand, Quyon, and George C. Bryant, first mate, Mattawa. Owing to the age of the vessel, the fire spread so rapidly that no attempt could be made to stay its progress, and the members of the crew, ten in number, barely escaped with their lives by jumping overboard and swimming ashore. The fire was first noticed about 1.30 by one of the deckhands, A. Gibson, who awoke to find the cabin full of smoke. He at once gave the alarm and rushing on deck found the amidships part of the vessel a mass of flames, which had burned the hawsers holding her to the wharf. The boat was drifting out into the stream, with flames shooting from every part of her. So quickly did the fire spread through the ancient timbers that the crew, hurriedly awakened out of their slumbers, had to dash through a barrier of flames and smoke to the deck.

"Charles S. Price" Salvage.—Salvage work on the sunken steamer Charles S. Price, known as the "mystery ship," was abandoned on July 25, by the Great Lakes Towing & Wrecking Co. Captain Cunning, wrecking master in charge, left for Cleveland, where he will make a detailed report to the underwriters. It is now probable that unless some wrecker cares to take a chance on blowing up the Price for the junk that is in her the boat is on the bottom for all time to come. In a statement made just before leaving Capt. Cunning said:—"We have abandoned the work entirely on the Price. There is nothing but a scrap heap there, and during the two working days that divers have explored the hull we have become convinced that it would be impossible to float the hull without spending a fortune, and there would be nothing to show for the work but a pile of junk. The interior of the steamer, in the boiler and engine rooms, indicates that the boilers exploded. I do not say this is true, but it is probable, as the aft bulkhead is shoved forward and the machinery is wrecked and pushed to-

"A little bigger; a little better."

Federation of the Empire. 1,200 Performers. 400 Musicians.

Gorgeous spectacle, symbolizing and epitomizing Imperial solidarity, power and cohesion. Mammoth scenic reproduction of British Houses of Parliament, Westminster Abbey and the War Office.

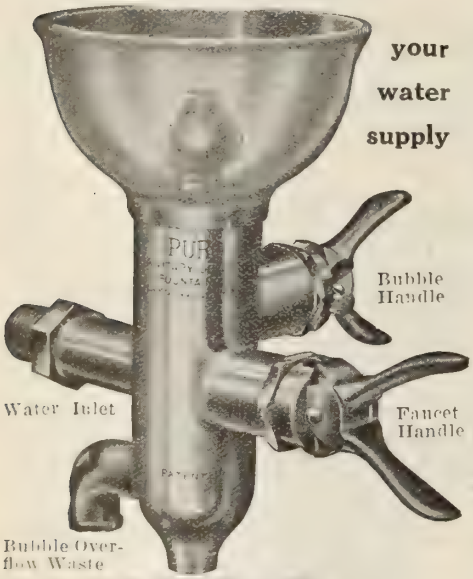
WAR—on land, in the air, on and under sea.

Scenes that have thrilled the world, re-enacted by Overseas troops. Model camp; trench warfare.

Anmer, the King's horse. Acres of manufactures. Glorious agricultural exhibits. Government exhibits and practical farm demonstrations.

wards the stern, indicating that an explosion or some other powerful agency tore everything to pieces. The aft section of the steamer is so badly damaged that repairs cannot be made under water. Our idea was to float the boat by compressed air, but with bulkheads broken and aft section damaged beyond repair, the air could not be controlled, and there was no chance. The aft and forward cabin sections are flat and part of the machinery is resting on the lake bottom. No bodies were found anywhere inside the hull, and if there are any in the vicinity they are so tangled up in the wreckage they never will be found."

"PURO -FY"
(MADE IN CANADA)



THE American Museum of Safety conferred a Gold Medal Award upon the Puro Sanitary Drinking Fountain at the First International Exposition of Safety and Sanitation.
The Puro Sanitary Drinking Fountain won because it deserved to win. Puro had merits that made it stand head and shoulders above any other drinking apparatus.

Safe Simple
SANITARY Economical
Quickly Attached

These are the qualities that forced the leading [illegible] sanitary engineers to pick Puro in preference to all others.
No drinking [illegible] is efficient that does not contain [illegible], and Puro was not [illegible] place. Puro was first.
Don't be satisfied with half way goodness, or makeshift [illegible] arrangements for your employees.
If the men in your factory must drink, give them a [illegible] drink.
Puro [illegible] rust or corrode.
Puro is [illegible]. It allows just the proper amount of [illegible] clean fresh water to come through the bubbler. No spurting, no overflowing [illegible]. Puro regulates itself. You can [illegible].
[illegible] in your factory and your [illegible].
We'll [illegible] what it will cost to "PURO-FY" YOUR WATER SUPPLY.

Railways—Bridges

London, Ont.—Traffic on the London & Port Stanley Railway has increased to such an extent that the Commission is preparing data so as to submit a by-law next January to secure money for double-tracking and increased equipment.

Brantford, Ont.—The building permit for the new Lake Erie & Northern station was issued here last Friday, subject to the carrying out of the award of the Dominion Railway Board in regard to the transfer of certain lands. Work on the foundation has started and the new station, which will be a handsome one, will cost $25,000. Schultz Bros. have the contract.

Contracts Awarded

Stratford, Ont.—The City Council have awarded the contract for construction of a steel water tower to the Chicago Bridge & Iron Works, Chicago. Approximate cost, $23,000.

The H. G. Vogel Co., of Canada, Montreal, has been awarded a contract for the installation of a sprinkler system at the Goodyear Tire & Rubber Co., plant at New Toronto, Ont.

Prince Rupert, B.C.—The City Council has let the following contracts for supplies required in connection with the new waterworks and power plant: Machinery, Canadian Fairbanks-Morse Co.; wood pipe, Vancouver Wood Pipe & Tank Co., steel pipe, hydrants, etc., Campbell, Gordon & Co., Vancouver; pipe fittings, etc., Letson & Burpee, Vancouver.

New Incorporations

The Milton Foundry has been incorporated at Toronto, with a capital of $40,000, to carry on a foundry business at Milton, Ont. Incorporators: A. Fasken, Duncan McArthur, and E. H. Brower, all of Toronto.

Feldspar & Clay Products has been incorporated at Toronto, with a capital of $1,500,000, to develop mining properties and treat ores and minerals of all kinds at Wiarton, Ont. Provisional directors are: T. M. Ferguson, J. P. Walsh and A. E. Kelly, all of Toronto.

Refrigeration

Galt, Ont.—In order to produce revenue from surplus water from artesian wells in winter months and as a means of preserving the health of the community, the Galt Water Commission is considering going into the business of making artificial ice.

Wood-Working

Magog, Que.—D. Audt's sawmill was recently destroyed by fire, the loss being estimated at $8,000.

Vancouver, B.C.—The Alberta Lumber Co., has ben granted a permit for the erection of a lumber mill to cost $100,000.

It means more shells, per machine per day.

STEEL OF EVERY DESCRIPTION.

Hawkridge Brothers Company
303 Congress St., BOSTON, MASS.
U.S.A.

Toronto, Ont.—The plant of Ewing & Murphy, wood turners, was completely destroyed by fire on July 25. According to an estimate made by Richard Ewing, senior partner of the firm, the loss entailed will be in the neighborhood of about $10,000. The loss is partly covered by insurance.

Catalogues

The Roller-Smith Co., New York, has issued bulletin No. 200 illustrating and describing fully the "Roller-Smith" portable direct reading bond testers.

Portable Ohmeters.—Bulletin No. 300 recently issued by the Roller-Smith Co., New York, describes and illustrates the "Roller-Smith" portable direct reading slide wire ohmeter in two types, the telephone and galvanometer type.

The American Pulley Co., Philadelphia, Pa., have issued a booklet entitled "Belt Pulleys" being a report of tests for belt slip. The booklet contains a description of testing apparatus, methods and results of test with five data sheets giving full particulars of the tests. There are also included a number of curves showing the slip for various types of pulleys.

Tumblers.—The Whiting Foundry Equipment Co., Harvey, Ill., have issued catalogue No. 120 illustrating and describing their line of tumblers and dust arresters for foundries. A brief specification is included covering the construction of the tumblers with detailed illustrations showing some of the parts, while the principal dimensions are given for the various sizes. Other lines dealt with include dry and wet cinder mills.

Foundry Ladles. — Catalogue No. 122, deals with a line of foundry ladles made by the Whiting Foundry Equipment Co., Harvey, Ill. The various types of crane ladles, crane truck and standard truck ladles, bottom tap ladles, etc., are illustrated and their principal features described. Tables are included giving the capacity and principal dimensions of the various sizes.

The Brown Hoisting Machinery Co., Cleveland, Ohio, have issued a catalogue dealing with the "Brownhoist" suspended concrete coal bins for power plants. The construction of the bin is described fully and a number of views are included showing several large installations. Other illustrations show the "Brownhoist" weighing larry and locomotive cranes in operation in connection with the coal bins. A list is included of some plants where bins have been installed.

Steel Shell Forgings or Billets of any size or weight will move any distance or about curves upon our specially constructed Gravity Carriers and Incline or Horizontal power devices. No labor required.

Canadian Mathews Gravity Carrier Co., Toronto

A Salesman Always on the Job

IT is the constant dropping that wears the stone away. It is the constant knocking at the door of attention and favor that in the end gives you ready access to the good-will of buyers of your merchandise.

You can keep up a constant knocking—a bid for attention, a reminder of yourself, a spokesman of your message—this by using regularly

The FARMER'S MAGAZINE

No man whose customers and should-be customers are farmers should be absent from their attention. Their will and purpose to buy may mature at any time. The salesman on the spot stands the best chance to get the order.

All this you know, but—do you live up to the behest of your knowledge?

Let us tell you more about **The Farmer's Magazine** in a special letter.

KEYSEATER
for Milling Internal Keyseats

This tool is an attachment for the drilling machine, and is regularly made with straight shank for gripping in the drill chuck; taper shank can be had if desired. The tool is fitted with a high-speed steel rotary cutter for milling internal keyseats in one cut. To complete a keyseat it is only required to pass the tool through the hole just once. Innumerable inexpensive eccentric bushings are supplied whereby the tool may be bushed to meet any diameter above its own.

Belt Pulleys by Charles A. Brinley. A reprint of a paper recently read before the Engineer's Club of Philadelphia and issued by the American Pulley Co., Philadelphia, Pa. The intention of the paper was to draw the attention of engineers to the question of pulleys for the transmission of power by belts, and to point out that there is more in the selection of pulleys of a proper type than has been commonly supposed. The conclusions were arrived at by means of a number of tests, particulars and results being given accompanied by charts showing the respective merits of various types of pulleys. A list of data sheets is included to which references are made in the text, and this list can be obtained along with the reprint upon application to the American Pulley Co.

The Vulcan Soot Cleaner Co., Du Bois, Pa., have recently published an attractive book dealing with the "Vulcan" soot cleaner as applied to boilers, superheaters, economizers, garbage destructor boilers, waste heat boilers and similar apparatus. The book is arranged in seven sections. Section 1.—"What Soot Really Is" points out the predominance of ash in most soot, and what happens if this is allowed to accumulate, not only as to reduction in efficiency, but by reason of the fusing and hardening of the deposit. Section 2.—"Why Clean Heating Surface Pays" gives the results of a large number of tests and investigations on the effect of soot deposit on efficiency of heating surface in boilers, superheaters and economizers, etc. Section 3.—"How Soot Cleaning Can Be Accomplished." Discusses the fundamental requirements of soot cleaning and what can be accomplished with hand-blowing. This is followed by a discussion of mechanical soot cleaning, which includes the principles of design of steam nozzles and their location in the boiler. Section 4.—Takes up the design of the "Vulcan" soot cleaner as applied to different types of water tube boilers. Section 5.—Is devoted to the "Vulcan" soot cleaner as applied to different types of fire-tube boilers. Section 6.—Is devoted to the application of "Vulcan" soot cleaners to economizers illustrating the design for both the straight and staggered tube types of economizer. Section 7.—"Details of Construction of the Vulcan Soot Cleaner," discusses the design of nozzles, anti-corrosion air relief valves and automatic tell-tale drain valves. The illustrations are unusually good and show the application of the "Vulcan" soot cleaner to various types of boilers etc. The frontispiece consists of a four-color reproduction of actual specimens of soot from different boilers and with different fuels.

Book Reviews

Conservation.—A report just issued by the Commission of Conservation, entitled "Conservation of Fish, Birds and Game," directs attention to the great value of these resources to Canada. The volume is a report of the proceedings of a conference of the Committee on Fisheries, Game and Fur-Bearing Animals of the Commission, and contains a fund of information regarding the present condition and the necessity for protection of Canada's fish, birds and mammals. Canada is taking a prominent part in the international movement for the protection of wild life. A Migratory Bird Treaty between Canada and the United States is under consideration. Through the influence of the Commission of Conservation and other interests, bird reservations are being created, where the birds may find safe nesting and breeding places. The fur-bearing animals of Northern and Western Canada are being rapidly exterminated. This is clearly shown by the present report. To secure their more adequate protection, the Commission is advocating the amendment of the Northwest Game Act to place responsibility for its administration upon the Dominion Parks Branch, which already protects the animals in the Dominion National Parks. The future of the fisheries of Canada is dealt with in an able manner by the highest authorities in this country. That they are of great present value is recognized, but there is also a potential value in our oceanic and inland waters which, upon development, would mean the creation of new industries. To meet this condition, the Commission is suggesting vocational training and simple demonstration stations for the fishermen, that they may take advantage of the most practical and modern methods of their calling. The report is replete with illustrations applicable to the subject matter.

Mechanical Engineer's Hand-Book, by Lionel S. Marks, Editor-in-Chief, 1836 pages, ($4\frac{1}{2}$ in. x $7\frac{1}{8}$ in.) limp leather binding. Published by the McGraw-Hill Book Co., Inc. N. Y., New York. Price $5.00 net. This is the first edition of a handbook intended to supply both the practising engineer and the student with a reference book which is authoritative in character and which covers the field of mechanical engineering in a comprehensive manner. The general arrangement of the handbook is based on "Hutte" and is the work of a number of specialists with Professor Marks as editor-in-chief. The various contributors are authorities on the subjects which they have contributed, a guarantee that the information is not

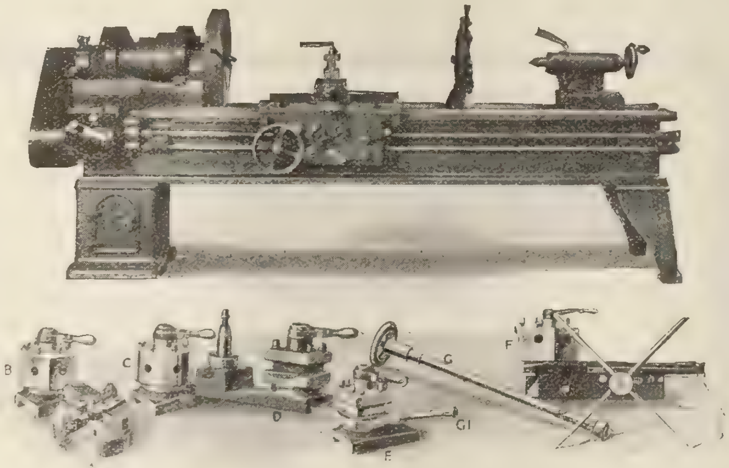
"PERFECTION"
THE NAME THE DESCRIPTION



Sizes 16x6, 18x8, 20x10

Edgar Bloxham, Inc.
Grand Central Terminal Building NEW YORK, N.Y., U.S.A.

Prices lower than any other lathe of same specifications because of volume of manufacture and fixed low percentage of profit over actual cost of production.

only reliable but that it at the same time follows the latest practice. While the subject of "Friction" and "Hydraulic Turbines" follow "Hutte" closely with the addition or substitution of American engineering data, the greater part of the book, particularly those portions which deal with engineering practice, are entirely new. The handbook is subdivided into fifteen sections well defined, dealing with major topics, and readily located by means of a thumb index. The first seven sections are to a large extent of a theoretical nature while the remaining eight are devoted to more practical subjects. The handbook contains a large number of well arranged mathematical tables of considerable value. The illustrations of which there are about one thousand, including charts and diagrams, have been carefully prepared and form a useful feature of this work. Engineers and students will find this a most valuable handbook, covering a wide range of subjects and dealing with each in a comprehensive manner. In addition to the thumb index there is one of important reference tables and a complete alphabetical index.

* * *

War Office and C.P.R.—The purchasing department of the British War Office for Canada is purchasing very extensively through the system and machinery of the C.P.R., and up to May 1, had placed orders in this country for $13,000,000 worth of various general supplies, not including munitions. Since May 1, orders aggregating about $4,000,000 have been placed. The Canadian Pacific, through Sir Thomas Shaughnessy offered to the War Office to handle the distribution of these orders without any charge other than any actual expenses, so they will not have any bearing on the earnings of the road.

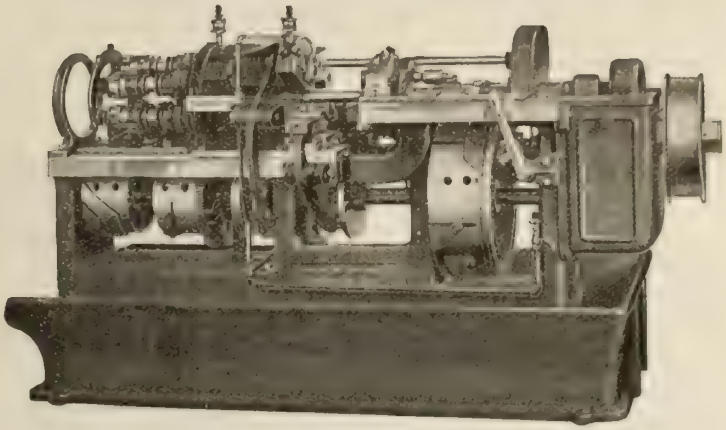
Features of
"New Britain" Six Spindle Automatic
Screw Machines



Tool and Forming Slides

THE TOOL SLIDE is of extremely rigid construction and so designed as to bring the ways on the center line. The latter are large and of such length that there is no overhang to tool slide when fully advanced. Extra large sockets are provided for tool holders. In consequence of these ample proportions of the tool slide, together with the equalization of the thrust above and below the center, work of the highest accuracy is insured.

The Forming Slides are entirely independent of each other. The one for rough-forming is mounted upon the frame; that for finish-forming being connected with the spindle cylinder housing. The advantage of this design ever a single slide for both tools are—greater rigidity, more solid backing to tools, freedom from chatter, and work of smoother finish. In case an extra slide is desired the cutting-off slide is amply substantial to permit mounting an extra tool holder block, so that forming can be done in the fifth position.

"New Britain" Six-Spindle Automatics are built in the following capacities: 1" x 5", 1⅝" x 7", and 2½" x 9".

2 No. 60 Heald Cylinder Grinders (nearly new).
1 16" x 66" Landis Crank Shaft Grinder (18 months old).
2 14" Swing Special Internal Grinders, capacity ½" to 14" dia. straight or taper.
1 New Yankee, style L, Drill Grinder (new).
1 No. 6M Besley Double Disc Grinder.
1 No. 300 Safety Emery Wheel Ring Wheel Grinder.

TURRET LATHES

58 Potter & Johnson No. 6-A Automatic (new).
8 Potter & Johnson No. 5-A Automatic (nearly new).
12 13" Gisholt Semi-Automatic (12 mos. old).
20 21" Gisholt Semi-Automatic (12 mos. old).
5 J & L two spindle (new).
1 J & L 2 x 24 with bar equipment, motor driven (fine condition).

MILLING MACHINES

1 No. 3 Garvin Universal (new).
1 No. 8 Becker Duplex (new).
1 No. 2 Rockford Hand Miller.
3 No. 0 Bristol Hand Millers.
1 Newton Duplex with 72" table feed.
1 No. 3½ Becker Vertical with Dividing Head.
1 Small Duplex Miller.
1 No. 4 Hendey type Lincoln Miller (nearly new).

DRILLING MACHINES

1 8-spindle Bausch Multiple, 1" capacity.
1 12" Spindle Garden ½" capacity.
6 Barnes 24" 2-spindle All Gear Drive (new).
1 24" Hoefer Sliding Head (new).
4 Henry & Wright No. 1 style K (nearly new).
12 Colburn Heavy Duty, size D-2 (new).
27 Colburn Heavy Duty, size D-4 (new).
1 26" Rockford Sliding Head (fine condition).
3 4-spindle Dwight slate, 14" swing, ¾" capacity.
2 Peerless 20" (new).
1 20" Mechanics (new).
1 20" Buffalo (new).
1 28" Hamilton Sliding Head.
11 Burke No. 1 Bench (new).
1 25" Kern Sliding Head with Tapping attachment.
362 Paragon High Speed Drills, 1¾" x 14" flute, 21" over all (new).

RADIAL DRILLS

1 36" Dreses, with quick return tapping attachment (fine condition).

ENGINE LATHES

38 16" x 8' Fairbanks-Morse (new).
1 18" - 36" x 8' Fay & Scott Extension Gap (fine condition).
1 30" x 12' LeBlond.
1 12" x 6' American.
1 28" x 14' Fifield.
1 14" x 4' Blaisdell.
1 No. 4½ Barnes.
1 54" x 21' Detrick & Harvey.
1 26" x 10' Bradford.

MARKING MACHINES

2 Noble & Westbrook No. 1 (new).

PROFILERS

1 No. 3H Becker (new).

PLANERS

1 30" x 30" x 10' Ohio with two heads (new).
1 44" x 44" x 12' L W Pond with three heads.
1 40" x 40" x 12' New Haven, with one or two heads.
1 36" x 36" x 12' Sellers widened to 72".

AUTOMATIC GEAR CUTTERS

1 No. 3 Brown & Sharpe 26" (old machine).
1 36" x 4" Fellows Gear Shaper (fine condition).
1 18" Schuchart & Schutte Tooth Rounder (nearly new).

CUTTING OFF MACHINES

1 4" Hurlbut-Rogers Cone Drive (fine condition).
18 Newton No. 500 Gold Saw Machines with 20" inserted tooth blades (new).

BELT LACING MACHINES

1 12" Jackson (new).

KEY SEATERS

1 No. 1 Catlin (new).

SCREW MACHINES

1 No. 3 Stecher (new).
1 1" x 8" Pierce (new).
3 No. 2 Southworth (nearly new).
4 No. 2 Warner & Swasey, with power feed turret (nearly new).
4 No. 54 1⅜" capacity National-Acme (used two years).
1 No. 4 B. & O. power feed turret, friction back gears.
1 No. 4½ B. & O., power feed turret, friction back gears.
1 2" x 24" Jones & Lamson Motor Driven (fine condition).
1 No. 6 Warner & Swasey 2¼" capacity back geared but no power feed to turret (nearly new).

BROACHING MACHINES

1 No. 3 La Pointe (nearly new).

BOLT CUTTERS

1 2" Landis Double Head (nearly new).

BORING AND TURNING MACHINES

1 4' Bickford Boring & Turning Mill (nearly new).
1 20" swing 4-Spindle Moline Vertical Boring Machine with 18" x 36" table.

BULLDOZERS

1 No. 4 Williams White (old).
1 No. 1 Williams White.

FILING AND SAWING MACHINES

1 Large Filing and Sawing Machine with 12" stroke.

PUNCHES AND SHEARS

1 No. 3 Walsh Punch Press.
1 Moser 1½" stroke Punch Press with Automatic Feed.
1 No. 17 Williams White Double End 8" throat capacity ¼" x ¼".
1 27½" throat lever punch ½" capacity 1¼" stroke.
1 Thompson Bevel Shear ½" capacity.

PIPE MACHINES

1 6" Saunders.

SHAPERS

1 14" Hendey Geared Friction.
1 20" Hendey Geared Friction.

TAPPING MACHINES

1 Garvin No. 1 Automatic (new).
4 Geometric High Speed Tapping Devices, style N (new).
4 Murchey 2" collapsible taps (new).

THREAD ROLLING MACHINES

1 Waterbury Farrell ⅜" capacity (nearly new).

THREADING MACHINES

5 Special Threading Machines for threading 3" steel shells (nearly new).

SPOT WELDERS

1 No. 3 Toledo Type 14-A 220 volts 60 cycles (nearly new).

Write us what you want new or second-hand.

MACHINE TOOLS - THE VERY BEST

GRINDERS.

Two (2) 14 x 72 Norton, plain, excellent condition, modern type, each	$2500
Two (2) 10 x 72 Norton, plain, excellent condition, modern type, each	2200
12 x 36 Cincinnati Universal	1250
No. 3 Brown & Sharpe Universal 12 x 50	2000
No. 60 Heald Cylinder	1000
Landis plain, 8 x 38	1400
Springfield Universal, 16 x 40	850
Two (2) No. 5 Rivet, each	550
No. 3 Brown & Sharpe Cutter Grinder	300
No. 7 Geo. Gorton, double end disc grinder with wheel chuck on one end, steel discs and tilting table	300
Diamond Side Type Shop Face Grinder, working surface of table 9" wide x 2' long, cup wheel 14" dia	300
Wells Cutter Grinder	75
No. 1 Peerless Surfacing Machine, 10" belt	75
Plain Grinders, Wet Tool Grinders, Polishing Machines, large and small.	

HAND MILLING MACHINES.

Two Chicago, each	200
Pratt & Whitney No. 2	175
Four Pratt & Whitney No. 1, each	125
Two No. 2 Garvin, each	150
Two No. 3 Garvin, each	175
Six Pratt & Whitney, No. 1½, each	175
Two Pratt & Whitney Hand Millers	...
Reed	150
Pratt & Whitney	150
Pratt & Whitney, with vise	150
Two Pratt & Whitney	...

HORIZONTAL BORING MACHINES.

No. 2 Beaman & Smith Combination Boring, Drilling and Milling Machine; good as new	5000

HORIZONTAL BORING MACHINES (Continued)

Beaman & Smith No. 8, 5" spindle	$3500
Bement & Dougherty No. 3, Knee Type, 3¾" bar	1450

PLANERS.

48 x 48 x 20' Putnam, 2 heads on rail; excellent condition.	3500
36 x 36 x 14' Powell, 2 heads on rail	1750
32 x 32 x 10' Gleason, single head; good as new	700

LATHES.

60 x 28' Fifield, raising blocks to swing 75", double back-geared, face plate drive, dia. of face plate 56" x 8"; good as new	5000
50 x 20' Fifield, Massive Pattern, 48" four-jawed chuck	2750
52 x 16' Gleason, heavy triple-geared, faced plate drive	2500
24 x 18' Lodge & Shipley, quick-change gear, taper, motor driven, carriage control	2000
16 x 8' Pratt & Whitney, quick-change gear, taper attachment, H.S., C.R.; good as new; latest type	1000

MULTIPLE SPINDLE DRILLS.

Bausch 8 spindle, 1¼" joints	1150
Foote-Burt 8 spindle, spindles adjustable on rail, center to center outside spindle 6' max	800
Snyder 28" 4 spindle, back geared, sliding head, table 30" long, 16½" wide	300
Five (5) Gardan 4 spindle, each	250
No. 11 Pratt & Whitney 15 spindle	325
Two 14" Barr 3 spindle Sensitive, each	90
No. 11 Pratt & Whitney, 10 spindle	325
2 spindle Barr	60
Bausch 16 spindle	750
Three 4 spindle Fenn Sensitive, adjustable heads, each	150
Allen 4 spindle	200
Henry & Wright 3 spindle	200

MACHINE TOOLS

The list below is a small portion of our present stock. Write for complete lists.

12 26"-48" x 14' new style McCabe Double Spindle Heavy Pattern New Lathes.
2—26"-48" x 18' new style McCabe Double Spindle Heavy Pattern New Lathes.
24" x 10' Putnam, H.S., C.R.
20" x 8' Prentice, H.S., C.R., T.A.
3—19" x 8' Sidney New Lathes, swing 21".
2—19" x 8' Sidney New Lathes, Quick Change, swing 21".
2—17" x 8' Sidney New Lathes, Quick Change, swing 19".
2—18" x 10' Rahn Mayer, H.S., C.R.
18" x 10' Cincinnati, H.S., C.R.
18" x 10' Hendey, New Taper Attachment.
9—17" x 8' National, New, Quick Change.
14" x 10' Prentice, Taper Attachment.
2—13" x 7½' Carroll, Jamieson, New.
40" Swing, 3¾" H.S. Conradson Semi-Automatic Turret.
No. 00 B. & S. Automatic Screw Machine, with slotting attachment.
⅝" Pratt & Whitney Screw Machine.
36" Baker Bros. Tapping and Boring Drill.
36" Currie & Snyder Sliding Head Drill.
30" Hamilton Sliding Head Drill.
No. 3½ Fox Miller, Vertical Attachment, Index Head.
Pedrick & Ayre Back-geared Miller, table swivels 42" x 9", 3 power feeds.
No. 210 Heald Wet Ring Grinder.
16" Steptoe New B.G. Shaper.
20" Steptoe New S.G. Shaper.
24" American B.G. Shaper.
18 x 18 x 5' Pond Planer.

24" x 24" x 6' Wood-Light
22" x 22" x 5' Whitcomb
18" x 18" x 36" Wheeler
30" Morton Draw Cut Shaper
14" Sellers Traveling Head Shaper

BORING MILLS.

10' Betts Vertical, two heads
6' Betts Vertical, two heads
66" Betts Vertical, two heads
62" Baush Vertical, two heads.
60" Bement-Miles Vertical, two heads.
60" Bement Vertical, one head.
50" Bement-Miles Car Wheel Mill.
30" Baush Vertical, turret head.
Barrett Horizontal, 5" bar
Beaman & Smith 2-Spindle.
Underwood New Cylinder Mill, 3⅝" bar.

MILLING MACHINES.

No. 2 Cincinnati Universal.
Ingersoll Slab, adjustable rail, platen 3 ft. x 12 ft., three heads.
No. 1-B Milwaukee Late Type Plain, Universal dividing head, chuck, vise.
76" Newton Heavy Duty Vertical, 48" circular table.
Newton Slab, platen 18" wide, 10' long
No. 1 Cincinnati Plain.
No. 2 Kempsmith Plain.
No. 9 Kempsmith Plain.
No. 1 Brainard Plain.
Detrick & Harvey Milling, Drilling and Boring.
Garvin Plain, No. 4½, No. 4, No. 3.
Newton Plain, table 7¼" x 36".

RADIAL DRILLS.

6' Pond Plain.
3' Bickford Plain.
3' Fosdick Plain, tapping attachment.

KEYSEATERS.

Baker Bros., 24" stroke.
Baker Bros. Colburn, 20" stroke.
No. 2 Mitts & Merrill, 13" stroke.
No. 0 Mitts & Merrill, 7" stroke.
No. 2 Davis, 4" stroke (2).

PRESSES.

DG-56 Ferracute, 4" stroke.
No. 1 Bliss, 8" stroke.
No. 4 Bliss Geared Double Crank, 3" stroke.
No. 2 Bliss Double Crank, 2" stroke.
Farrell Press, 2" stroke.
PG-6 Ferracute, 1½" stroke.
No. 4 Farrell, 1½" stroke.
Fowler, 1¼" stroke.
No. 3 Manville Stamping, 1" stroke.
350-ton Hoe Hydraulic.
200-ton Robertson Hydraulic.
100-ton Sellers Hydraulic Wheel Press.

PUNCHES AND SHEARS.

Sellers Double Angle Shear, capacity 8" x 8" x 1".
8' Lennox Rotary Splitting Shear, split 16' plates.
Lennox Rotary Splitting Shear, split 12' plates.
Bement Plate Iron Shear, 26" throat.
Bement Punch, 31" gap.
Cockburn & Barrow Punch, capacity 1" in 1".
Kling Bros. Punch, 24" throat.
Reed Cleveland Punch, 22" throat.
Bass D. E. Punch and Shear, 20" throats.
Wilson Kalamazoo D. E. Punch and Shear, 6" throats
Style D Long & Alstatter Shear, capacity 3½" round stock.
No. 2 Long & Alstatter D.E. Punch and Shear, 12" throats
No. 10½ Badger State Punch and Shear.

1 18 x 8 American Tool Works, quick-change gear; new.
1 18 x 6 Reed; nearly new.
5 16 x 8 Single purpose, suitable for rough turning 6" shells; new.
1 14 x 6 Champion; new.
1 14 x 6 Bertram, hollow spindle, compound rest; A1 condition

DRILLS

1 24" Barnes, sliding head.
1 20" Davis back-geared; used.
1 14" Henry & Wright, ball-bearing; used.
1 14" Avey, ball-bearing; used
1 12" Barnes Pedestal.
1 3-spindle Reed.

MISCELLANEOUS.

1 Plain Miller, with Dividing Head; used.
1 New 16" Back-geared Ohio Shaper.
1 24" McGregor-Gourley Back-geared Shaper, with vise and countershaft; used.
1 25 H.P. Motor; second-hand.
1 10 H.P. Motor; new.

Every used tool listed guaranteed as represented, otherwise returnable.

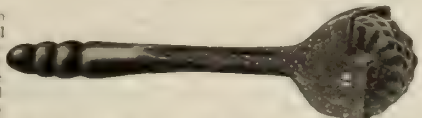
TORONTO, ONTARIO. CANADA
Office—110 Church Street Factory—14 Darling Avenue



"Keep Wheels Dressed" is just as important as "Keep Tools Sharp"

Diamo-Carbo Grinding Wheel Dressers are an economical substitute for the Black Diamond Dressers. They are so low priced that each grinding stand may be provided with its own Dresser. Sherman-Huntington—For use on large and coarse wheels upon which the Diamond cannot be used, the Sherman-Huntington is the most satisfactory Dresser ever designed. Made in three sizes with either Corrugated or Toothed cutters. The No. 2 with Cutters $2\frac{5}{8}$" in diameter is a wizard for use on the hardest wheels. Provided with hood to protect user from flying particles.

We also manufacture Diamond Dressers

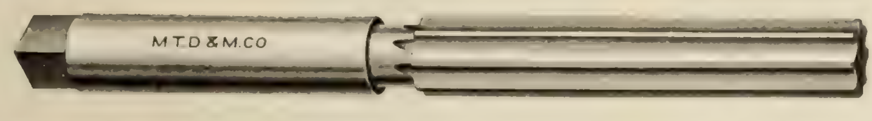
HAND REAMERS



ARE RATHER FUSSY THINGS TO MAKE. THE FLUTES MUST NOT ONLY BE JUST THE RIGHT SHAPE BUT MUST BE JUST IN THE RIGHT PLACE. THE SIZE MUST BE ACCURATE AND THE CLEARANCE MUST BE ENOUGH TO MAKE A FREE CUTTING EDGE YET NOT ENOUGH TO WEAKEN THAT EDGE. WHEN WE FINISH A "MORSE" REAMER IT REPRESENTS QUITE A BIT OF WORK BUT IT IS READY TO DO A LOT OF WORK. THAT MAKES IT A WORTH WHILE TOOL FOR YOU.

MORSE TWIST DRILL & MACHINE COMPANY

NEW BEDFORD, - - MASS., U. S. A.

PIPE VENTILATED A C MOTOR
FOR VERY DIRTY PLACES

A PROOF OF SINCERITY

We speak in behalf of all manufacturers who have adopted a course identical with ours in dedicating every facility to the service of the old-time customer.

◆ ◆ ◆

In spite of this precaution we have been unable to maintain our prompt delivery service of former days. Perhaps you have taken this to be an indication of insincerity on our part, or a token of our lack of appreciation of your difficulties? Such is far from the case.

◆ ◆ ◆

We understand full well how intense is your need for tools and we are pitting every ounce of our production against the incoming flood of your demand—we are sincere in our desire to serve you—if we were not, we could long ago have accepted a temporary but extraordinarily profitable type of business as a substitute for yours. But we didn't.

◆ ◆ ◆

Shouldn't the mere fact that we chose to forego this extra profit be proof sufficient that we are genuine in our desire to serve you and that we are now doing our level best to supply you at the time and in the quantity you want?

The woods are full of them

Judges have been numerous in Canada who have come down off the bench to lead the people—who have stooped to conquer, as it were—Blake, Mowat, Thompson, Meredith. And so there is plenty of precedent for a move which is being talked of in the Liberal party—the grooming of Mr. Justice Duff for the leadership of the party against the day when Sir Wilfrid Laurier will seek his ease. Mr. Justice Duff is a member of the Supreme Court of Canada, but it is said that, should the boom in his favor reach a suffcient volume, he will be willing to step down from the bench and get into the fight.

This makes the basis for an extremely interesting article by H. F. Gadsby in the September issue of MacLean's Magazine. Mr. Gadsby discusses the Duff boom in a thoroughly impartial way, and tells something of the young Judge who may be slated for so high an honor.

"The Duff Boom" is but one of many features in the September MacLean's. The number bristles with bright stories and powerful articles by such clever and famous contributors as Arthur Stringer, Agnes C. Laut, Robert W. Service, Arthur E. McFarlane, Alan Sullivan, Mrs. Arthur Murphy (Janey Canuck) and many others. It is Canadian from cover to cover the best reading obtainable on this side of the border.

CANADIAN MACHINERY
AND MANUFACTURING NEWS

A weekly newspaper devoted to the machinery and manufacturing interests.

Vol. XVI. TORONTO, AUGUST 17, 1916 No. 7

EDITORIAL CONTENTS

Mechanical Applications of Oxy-Acetylene Welding Apparatus 169-171
General 171-172
Foundrymen's Convention and Exhibition....Place and Purpose of Inspection Department....Contraction Cavities in Spur Wheel Blanks.
Production Methods and Devices 173-174
Fixture for Shearing Pins....Holder Which Saves Erasers....Chart for Finding Weight of Cast Iron Pipe....Molding Hand Grenades.
General ....
Scrapping vs. Repairing.
Contemporary War Articles 175-177
Forging Department of a British National Shell Plant.
General 177-178
Don'ts for Grinding Machine Operators....Unorthodox Patterns.
Editorial Correspondence 179-180
Machinists' Instruction Course—I.
General 180-181
Erecting and Oiling the Lathe....Our 1916 Iron and Steel Output....Every Man to His Own Trade.
Progress in New Equipment 182-185
Uniflow Engines for Driving Rod Mills....Polishing Lathe With Push Button Control....Portable Light and Acetylene Generator....Combination Rubber and Steel Valve....Core-making Machine for General Work....Mechanical Shell Banding Press.
Editorial 186
Our Munitions Production Shortage—Why?
Industrial Notabilities 187
Percy C. Brooks
Selected Market Quotations 180-190
The General Market Conditions and Tendencies 190-193
Montreal Letter.. Toronto Letter....Lachine Canal Traffic in July.
Industrial and Construction News 194

The "HENDEY" Lathe

The Service

Capacity and Convenience

of a Hendey Lathe will prove of vital importance to your tool room.

The **"Hendey"** is accurate in the highest degree and **suited for the efficient use of watch tool chucks, stop chucks, relieving attachments, etc.**

It has the best spindle construction in its taper journals, with annular bearings and automatic oiling rings, which make for accuracy of alignment.

It has **automatic stop** for carriage working in either direction. Has reverse for carriage, controlled from apron.

Wide range of threads and feeds through mounted gearing, with ability to make gear changes for additional threads and feeds without limit.

A card will get you full particulars. Why not mail it now?

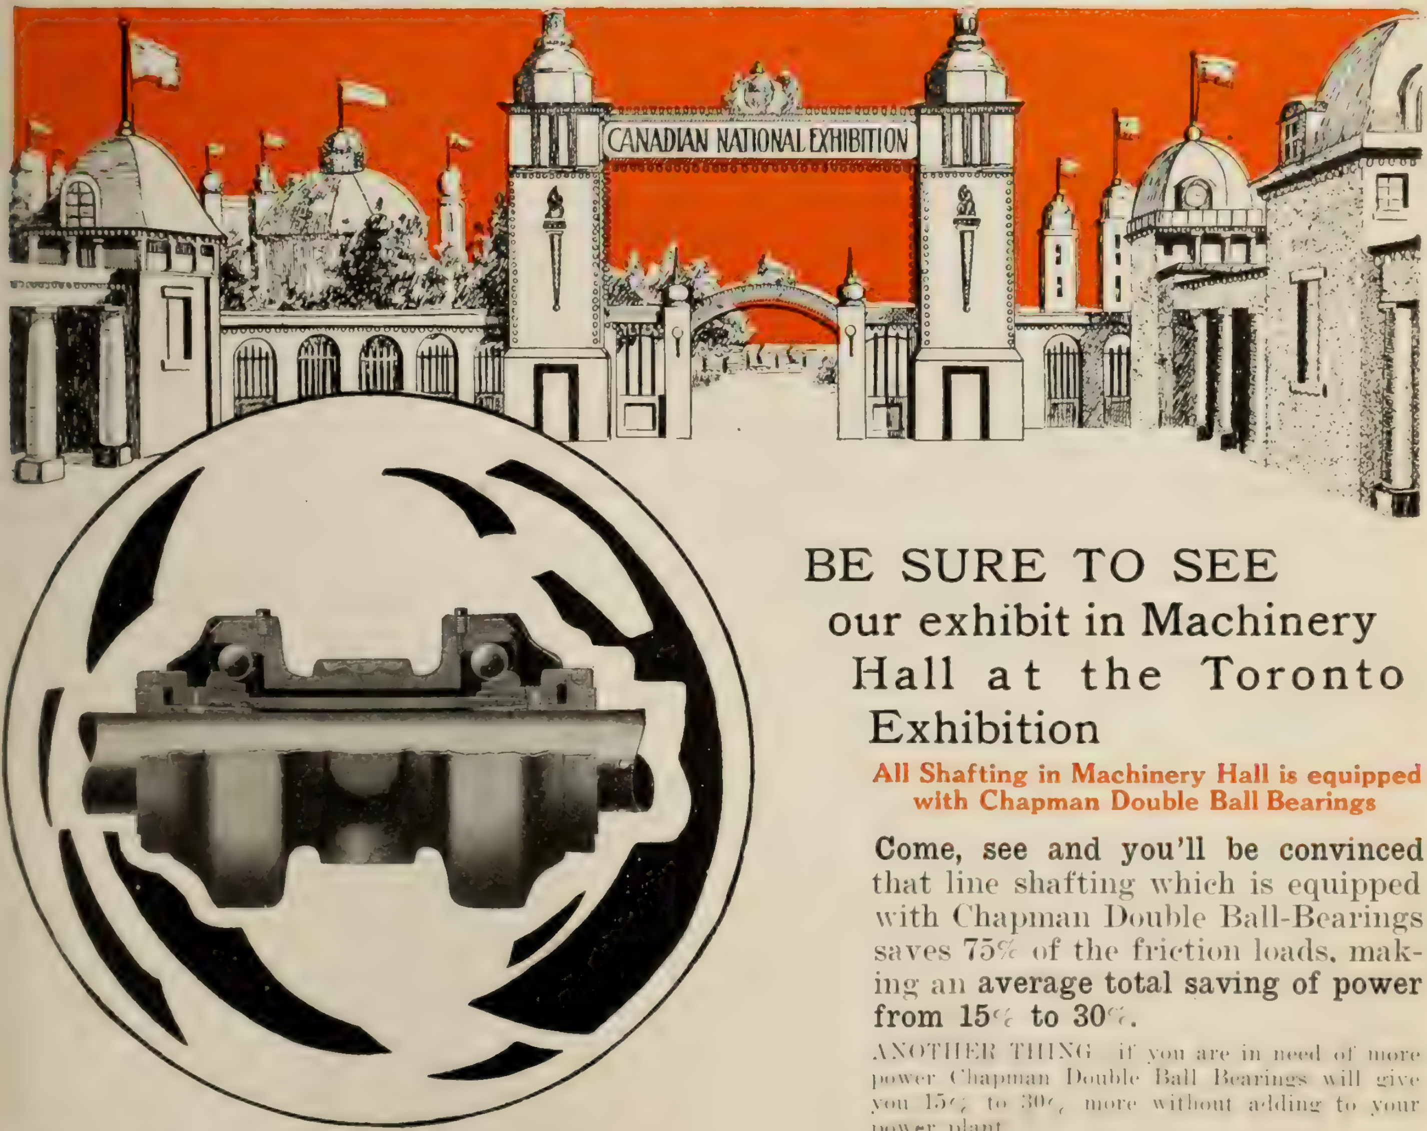
CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by The MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

Vol. XVI—No. 8 Publication Office: Toronto, Aug. 24, 1916 Subscription Price $3.00 per Year



BE SURE TO SEE our exhibit in Machinery Hall at the Toronto Exhibition

All Shafting in Machinery Hall is equipped with Chapman Double Ball Bearings

Come, see and you'll be convinced that line shafting which is equipped with Chapman Double Ball-Bearings saves 75% of the friction loads, making an **average total saving of power from 15% to 30%.**

ANOTHER THING if you are in need of more power Chapman Double Ball Bearings will give you 15% to 30% more without adding to your power plant.

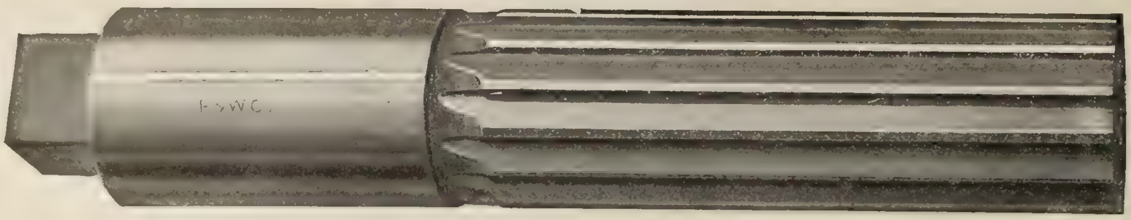
Oiling and attention are reduced to a minimum. Lubrication is only required twice a year.

Chapman Double Ball Bearings fit any adjustable hanger, and the change can be made with but little delay to you.

Used in over 2,000 Canadian Factories.

Write for full particulars.

The Chapman Double Ball Bearing Company of Canada, Limited
339-351 Sorauren Avenue, Toronto, Canada
Transmission Ball Bearing Co., Inc., 32 Wells Street, Buffalo, N.Y.



This Reamer Has

ECCENTRIC RELIEF

The feature that gives it a

Safe Lead Over all Others in the Cutting Race

Here's the reason why:

1. The section of the tooth is greater than when flat relief is used and therefore the reamer is stronger.
2. Reamer does not chatter.
3. Smoother hole is produced.
4. Working size of reamer can be retained longer.

Eccentric relief is a Patented Feature of

All P. & W. Reamers

Do Your Taps Cut Like This?

Illustration to right shows P. & W. Taper Hand Tap, after being forced by power nearly through a nut in which the hole was purposely drilled considerably smaller than the root diameter of the tap.

P. & W. TAPS

Freest Cutting **Longest Life**

This, of course, left an excessive amount of work for the tap to do. Yet, because of the design and construction of the tap, there was no evidence of imperfect threading or any indication whatsoever of the hard usage to which the tool had been put.

Advice to the Budding House-Organist

A Letter from an Old Advertising Man Who Has Been Through the Mill

DEAR BILL: I note with no little anxiety that you are "thinking of starting a house-organ," and that you want my advice. Do you really want *advice,* I wonder, or do you expect me to tell you a lot of things to make you feel good? Does the fact that you are "thinking of starting a house-organ" mean that you have set your heart on it, or are you seriously considering its cost to your firm in relation to the profits it may probably bring to the business? In other words, are you regarding it with an eye to the company's benefit exclusively, or have you a sneaking suspicion that it may shed lustre upon your personal reputation?

Them are crool words, I know, and you may get sore—and if you *do* get sore just remember that you asked for "advice," not compliments. But if you are really and truly thinking of the house-organ as a means of promoting the company's business without any bob-tailed notion of advertising your own cleverness, you won't get sore. So if you feel yourself getting hot under the collar by the time you have read this far, my advice is very brief. Don't gamble with the company's money.

Assuming, however, that your gorge hasn't risen, and that you only smile good-naturedly at my ill-founded suspicions, I shall proceed. Do I think you are capable of editing an interesting and instructive house-organ? I most certainly do. But whether you can do it with your left hand while your brain is occupied with the thousand and one problems of your job is another matter. Believe me, son, the publication of a house-organ which returns dividends on the investment is no between-times job. You'll have to nurse it, and coddle it, and give it castor oil, and walk the floor with it rather more than you would with a human baby. You can hire a bright young man to polish it off with a lick and a promise, and put it to bed on a cylinder press, but it will never grow into anything but an expense. Just go and take a good look at the editorial equipment of any influential trade-paper, and then ask yourself if you can hope to compete with it by delegating a sub-assistant to paste down clippings.

In the first place, you have got to determine that there is actually a need which your publication can supply, and that need must actually *exist.* You can stimulate it, and awaken it, and make it stronger; but you can't *create* it. You can't assume that it exists, and then proceed to satisfy it. I remember well an experience of my own in editing a house-organ for the employees of a certain sizable organization. It was reall a respectable-looking publication—32 to 48 pages standard magazine size, two-color covers, plenty of half tones. It had a staff of maybe a dozen people par time, and no publisher would be ashamed of it eithe as regards mechanical make-up or character of contents It contained articles about the product, stories of har sales which had been put over, uplift editorials of pretty decently high order, athletic notes, a few goo jokes, and a lot of personalities about people in the organization. Put it alongside any similar publication and it would stand well up in the front ranks. But i had a sudden and tragic death.

Unless your house-organ is to be merely a collectio of circulars advertising your own product and disguise with a cover and a date line, you are up against th same problems which face any independent publishe Unless he can locate an actually existing desire whic can be satisfied—it needn't be a *conscious* desire nece sarily, but it must exist somewhere outside his imagin tion—he isn't likely to get very far. He can succeed i two ways: by discovering a new field (that is to say, b satisfying a group of desires which has hitherto go unsatisfied), or by serving an old field *better* than it being served by the publications which are already existence. I am talking about *successful* publicatio mind you, that have a real influence upon the opinio of their readers, or which are regarded with confiden in the quality of the information or entertainme which they furnish. That's the class you must p your house-organ into if it is really going to represen profitable investment—unless, as I said before, y merely intend to send out a bunch of direct advertisi under the guise of a publication.

All of which may sound decidedly discouraging, b let me tell you that discouragement in large chunks what the budding house-organist chiefly needs. T high mortality rate among house-organs proves th without any further argument. If your faith in proposition is high enough, and your analysis of problem is clear enough to overcome criticism and paragement, why go to it. You're the judge. B don't let the itch to play with a publication get so str that you don't notice the pricks of conscience or prods of good judgment.

Sincerely and affectionately,

YOUR UNCLE, (*in Printers' Ink.*)

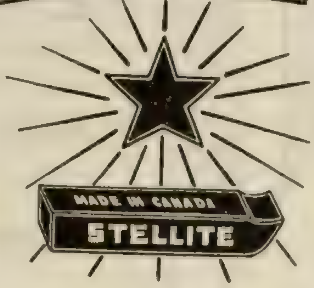
STELLITE

The New Alloy High-Speed Cutting Metal



Is not a steel.
Contains no iron.

"Stellite" Tools Set the Pace for Fast Cutting

They will stand up under the fastest speeds that your machines can drive them.

They take *heavier feeds and cut much faster than steel tools* because they are harder, tougher and are not susceptible to heat. They cut when red hot just as well as when cold; there is no loss of temper.

They *do 20 to 100 per cent. more work than steel tools* and require less attention to keep a keen edge.

Save money at the point of the tool.

It will be well worth your while to try it.

STEEL

for SHRAPNEL SHELLS AND SHELL BLANKS

Only Company in Canada producing steel ingots by the "HARMET" Liquid Process.

REASONS WHY THESE INGOTS ARE SUPERIOR TO THE ORDINARY KIND:

1. Prevention of cracks, due to shrinkage; of internal stresses and resulting cracks and fissures.
2. Early cessation in the crystallization of the metal, and the production of fine crystallization of the metal, without cleavage planes.
3. Lessening of segregation, i.e., reduction of tendency to carbon and other impurities to concentrate in the central and upper parts of the ingot.
4. Prevention of "Pipes" or interior cavities, and thus preservation of absolute solidity in the ingot.
5. Improvement in physical properties.
6. Reduction in waste of ingot.

WE CAN SUPPLY FORGINGS OF ALL SHAPES AND SIZES MADE OF ORDINARY OR "HARMET" FLUID COMPRESSED OPEN-HEARTH STEEL ON THE SHORTEST NOTICE.

For Turning, Facing and Milling the Thread on Gas Check Plugs for 6-inch High-Explosive Shells.

THE BANFIELD PLUG MILLER

Patents applied for in Canada and United States

THIS machine is especially designed for finishing base plugs, turning the outside diameter, finishing the face with any camber desired, and milling the thread, all in one chucking, the complete plug being finished in six minutes by unskilled labor.

The machine is equipped with quick draw in collet. Drive pulley 18" x 6", with bronze bush having cut jaw clutch for turning and facing. Worm gear 100 to 1 ratio, with cut jaw clutch for milling, driven by 10" x 1½" flanged pulley. The milling cutter is driven by an 8" x 2½" flanged pulley. Tool post carriage is equipped with power feed (two speeds) having automatic stop. Power feed pump with relief valve driven from worm shaft **(all drives direct from main line shaft).** Rigidly built, simple and economical to operate.

Weight 1,800 lbs.

For 18 pdr., 4.5 and 60 pdr. High Explosive Shells. Can furnish machines of same type, but somewhat lighter in construction. Particulars on request.

These machines are tooled up for finishing plain machined plugs if desired.

Write for prices and deliveries.

Potter & Johnston 15-inch Universal Shaping Machine

Simplicity of design, convenience, extreme care exercised in their manufacture, and the many universal features of the machines, combine to make the UNIVERSAL SHAPING MACHINES the most efficient and thoroughly reliable tools of their type on the market to-day, and place them in a class by themselves. The above illustration shows our 15" Universal Shaping Machine with Swivel table having auxiliary tilting side, power down feed on any angle, POWER ROTARY FEED for planing internal curves, automatic feed stop, graduated collars on tool head feed screw and table feed screw, swivel vise with graduated base.

KEMPSMITH

UNIVERSAL MILLING MACHINES

When installing a Universal Milling Machine for tool room work, one of the prime considerations is simplicity of machine and convenience of operation.

Kempsmith Milling Machines are notable leaders in these two requirements. Note especially that all feeds are reversed by one lever at the front of the knee. Likewise all power feeds are tripped and engaged by one compound lever, also located at the extreme front of the knee. The swiveling table is clamped rigidly at any angle by a quarter turn of a single bolt.

Our catalogue illustrates and describes more fully the features mentioned. A copy will be gladly sent on request.

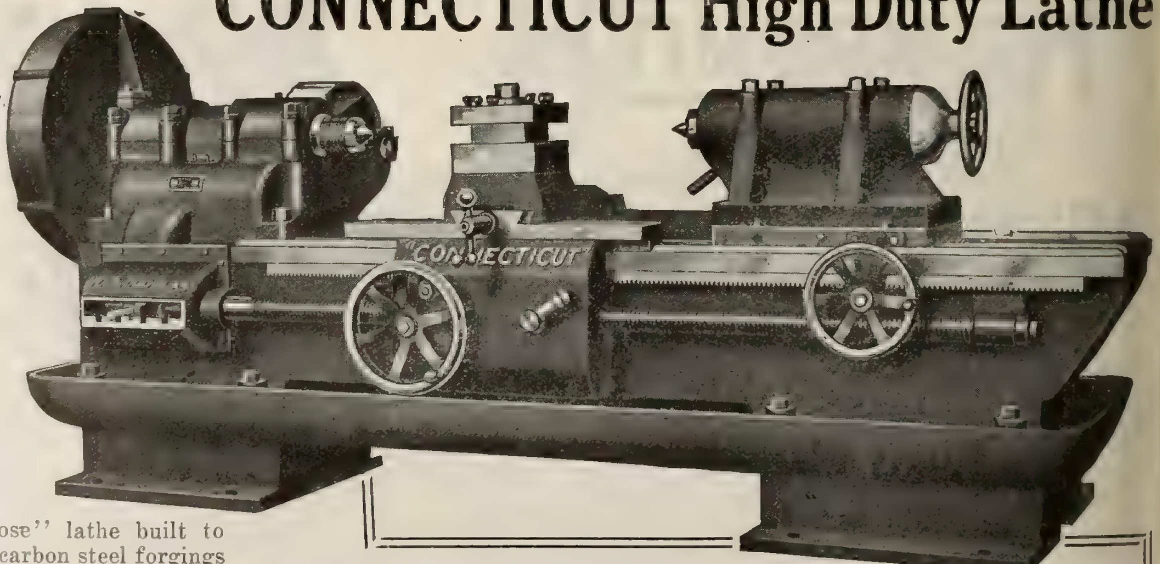
METAL and WOODWORKING MACHINERY of all Kinds

CONNECTICUT High Duty Lathe



Sets the pace on HEAVY WORK

A "Single Purpose" lathe built to turn or bore high carbon steel forgings at maximum speeds.

It is in all respects heavier and more rigid than standard 30-inch or even 36-inch lathes giving the same distance between centers.

The usual cutting speeds on shell work are 40 to 50 feet per minute on shells up to 8" diameter, 30 feet per minute on larger sizes. Depth of cut from ¼" to ⅝", depending upon the eccentricity of the piece. Our lathes will stand more than this.

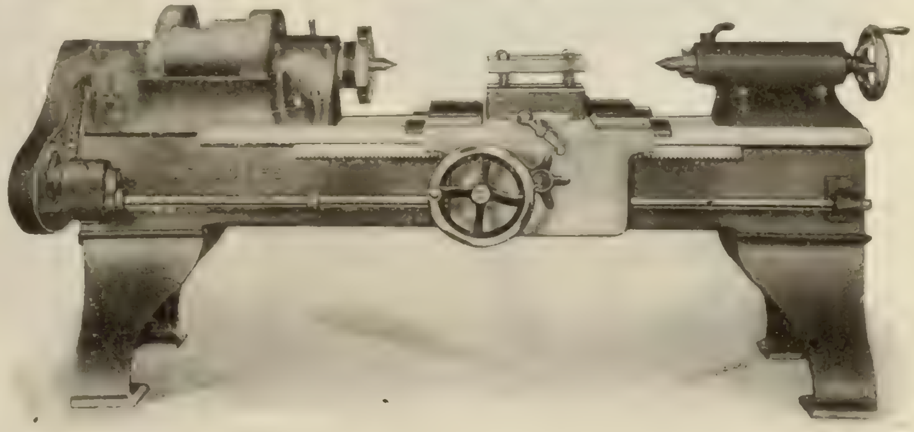
We admit the **Big Gear** is not particularly handsome, but it eliminates the train of small gears, and adds greatly to the strength and wearing qualities.

Write for bulletin giving full details.

W. & B. DOUGLAS, ***Middletown, Conn.***

How Lathe Simplicity Solves Labor Problems

The great simplicity, the compact, convenient design, make the Hercules Lathe an ideal single-purpose machine. To train an unskilled laborer to perform accurately one or two operations on this machine requires but a short time. The rugged, powerful construction then enables that laborer to turn out precise work continuously at the maximum speed.



Where skilled mechanics are not always available — the Hercules Single-Purpose Lathe is the logical machine tool.

At the present time, we can still make early deliveries. Write — at once—for full details.

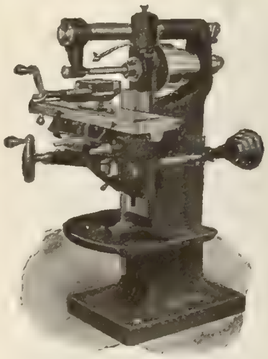
Cut Your Shop Costs

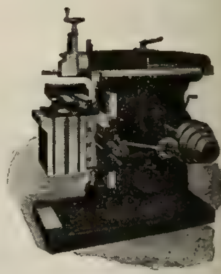


Nobody would think of putting 16-inch lathe work on a 30-inch lathe, then why leave small parts on a large Milling Machine?

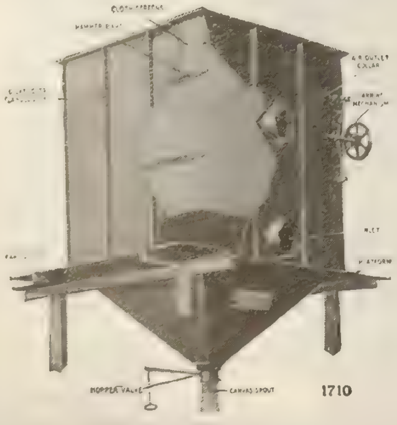
A Steptoe Hand Miller or small power feed can be handled quickly and will cut your production cost. You will have less money invested in your Milling Machines and have more machines to do the work.

That same principle applied to your small planer work will cut the cost of planer work.

A Steptoe Shaper will do the work faster because it can be handled quicker.



The John Steptoe Company, CUMMINSVILLE, CINCINNATI, OHIO, U.S.A.



Dust Collecting Systems

One Paragraph From A Machinery Dealer's Letter:-

PEERLESS
PEERLESS MACHINE Co. RACINE WIS. U.S.A.

"One of our customers has recently purchased from us two of your 6" PEERLESS High Speed Power Hack Saws, and they now wish to install several more, providing we can take some of their old hack saws in exchange. They claim these old machines are as good as new, but they consider the PEERLESS so far superior to the others that they would like to fully equip their factory with PEERLESS Machines."

The principle of construction in the PEERLESS High Speed Heavy Duty Cutting off Machine admits of a cutting speed which cannot be approached by the ordinary type of machine. The output of the machine is controlled by the efficiency of the blade. At the maximum speed which this machine is guaranteed to operate it cuts off a 3 in. round cold rolled bar in 1½ minutes.

Bearings are extra large. The ones that are subject to excessive wear are made of steel hardened and ground, which eliminates the continuous [illegible] and repairing that ordinarily is the case when a machine is worked to its utmost.

PEERLESS MACHINE COMPANY
1607 Racine Street RACINE, WISCONSIN

SPEED SPEED

This pile of 1-inch square steel bars was cut in nine hours with a

Racine Metal Cutter

with ONE BLADE at a blade expense of six cents.

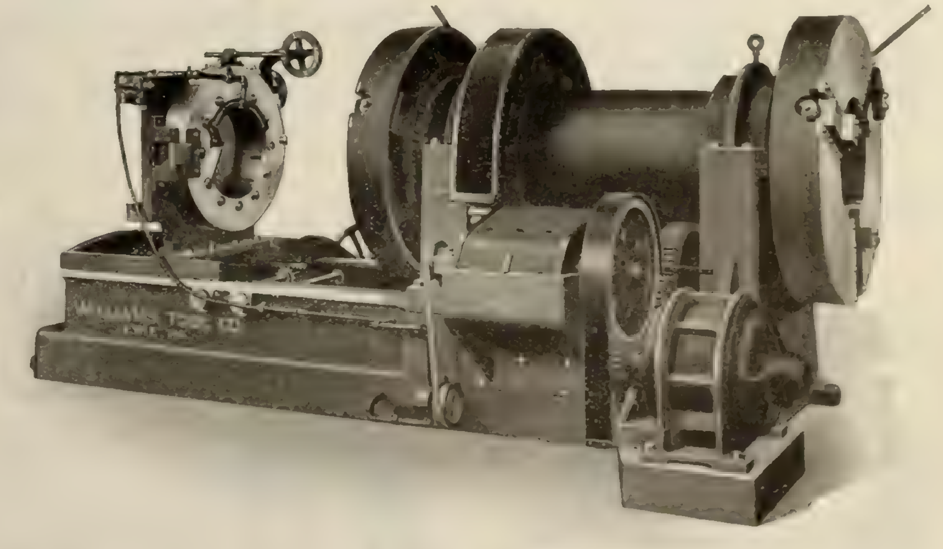
WILLIAMS PIPE MACHINES

Received Highest Award at Panama Exposition



The Following Letter Explains Why:

Williams Tool Co., Erie, Pa.: Rochester, N.Y., 12-3-14.

Gentlemen:—We are so pleased with our No. 3 Pipe Machine, and it is doing such splendid work for us at a minimum of expense that we are now considering the advisability of displacing two smaller machines for one of your No. 1½ or No. 2 motor drive.

The machines which we would displace, if we make a change, are belt drive, are (names of two of the oldest and best known machines on the market) equipped with nipple holders, extra dies, etc. Both of these machines are still in fairly good condition. On what basis could we make an exchange with you?

Yours very truly, SAMUEL SLOAN & CO.

WILLIAMS TOOL CO. - - - ERIE, PA.

—He's a Poor Workman

who complains of his tools, as a general rule. But he's a poorer workman who, knowing his tools are inefficient, does not complain.

Educate your men to turn in their files the moment they reach their "inefficient point." That will give them no excuse for poor work.

The cost of the extra files will be much less than the loss in labor, time and mental energy spent in using files that have worn smooth.

Send for a copy of our book, "File Filosophy." It is worth the while of any manager, factory superintendent, shop foreman and workman to read it.

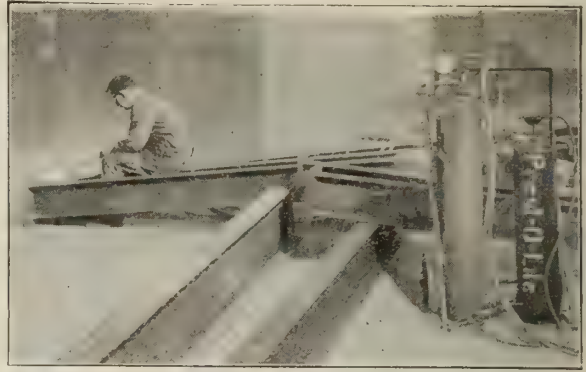
Oxy-Acetylene Welding and Cutting



Welding "shoe" on steel "I" beam used in large construction job—saving time and labor.

Even the Smallest Jobs Show Important Savings

Once you become accustomed to specifying oxy-acetylene welding wherever two pieces of metal are to be joined—in manufacturing, construction or repair jobs—the opportunities for savings of time, labor and materials increase at a surprising rate. Even the very small jobs—oftentimes made to seem large solely through adherence to old, cumbersome methods—can be made to show important savings.

Just as the simple welding of base plates to the steel columns, illustrated above, saved valuable time on a "rush" construction job, you will find that the oxy-acetylene process can make regular savings for you in hundreds of similar instances. In making shop repairs, expensive dismantling, costly replacements and annoying delays are eliminated, the work being done right "on the spot." Just one important repair, preventing a serious tie-up in production, might easily repay you for all needed welding apparatus and years of Prest-O-Lite service.

Shops large and small have an equal opportunity to secure this efficiency, economy and simplicity through the

Prest-O-Lite PROCESS

Employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene (ready-made carbide gas) is backed by Prest-O-Lite Service, which provides dry, purified gas, insuring better welds, quicker work, and lower cost, and also avoids the large initial outlay and heavy depreciation incurred in making crude acetylene in a carbide generator.

The necessary equipment is not expensive. We furnish high grade welding apparatus for $75; acetylene service at additional cost. Also adaptable for oxy-acetylene cutting by the purchase of a special cutting blow-pipe. Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene—any average workman who understands metals can learn the process quickly and easily.

Send for special reports, engineering data and illustrated literature covering a wide range of welding and cutting work—it is bound to prove valuable to you.

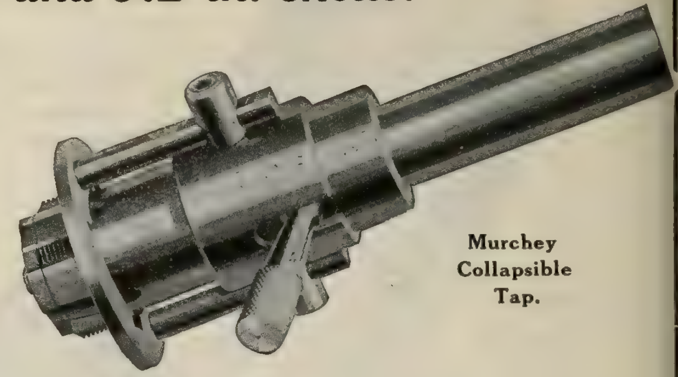
MURCHEY
TAPS AND DIES

—very extensively used on 6-in., 8-in. and 9.2-in. shells.

The great advantage of using MURCHEY COLLAPSING TAPS AND DIES on large shells



Murchey Collapsible Tap.

MURCHEY Taps and Dies save the buying of extra machines. The time alone required to thread one of the large shells, together with rehandling, will more than pay for the tap in a very short time.

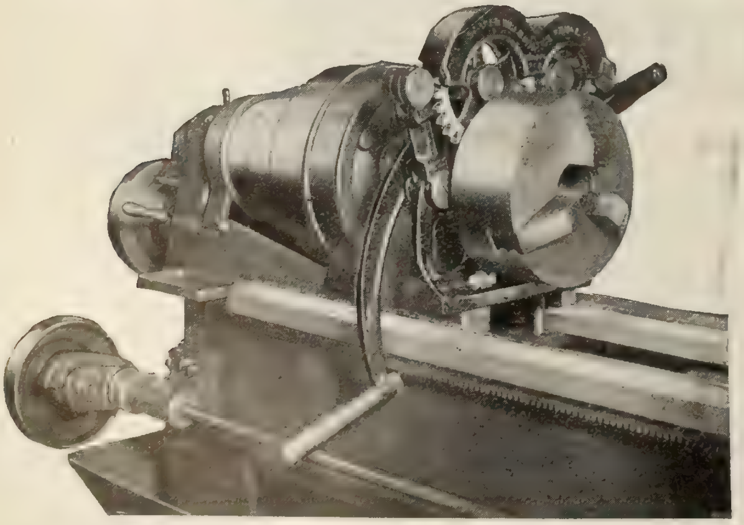
The largest American firms are doing all the threading on shells with Murchey Collapsing Taps and Murchey Self-opening Dies, and are getting most desirable results.

They save the time of rechucking and rehandling, the possibility of the shell getting out of center. By using a roughing and finishing tap they are able to tap the base and nose of these shells in about one-fifth of the time it requires on a thread miller and produce accurate work.

Send us Blue Prints of your requirements and we'll gladly quote you on the necessary tools.

Murchey Machine & Tool Company
75 Porter Street, Detroit, Mich.

Speed Up! Production
With a Barker Wrenchless Chuck



You don't consider money spent, on something which will bring returns—it is invested.

A chuck which will cut the time of setting-up in half and at the same time not be prohibitive in initial cost or maintenance is a most worth-while investment in your plant—is it not?

Barker Wrenchless Chucks are proving their worth as an investment in many plants where multiple chucking has been a profitless bugaboo—perhaps your neighbor is a Barker fan—let us send you a list of users in your territory.

An inquiry to-day will bring the Barker proposition to you by return mail. You can't go wrong and you do not obligate yourself in any way whatsoever.

The entire opening and closing operation is accomplished with a short action of the hand lever—think what this means in saving of time.

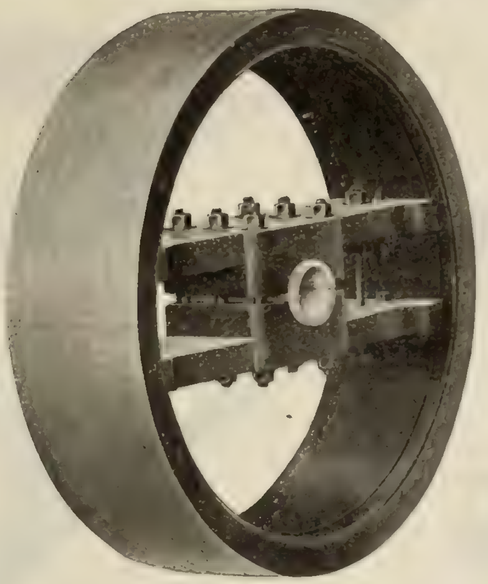
PULLEYS

No Keys

No Set Screws

In Perfect Balance



Lighter

Stronger

Better Belt Surface

The Dodge Standard Wood Split Pulley

The Wood Split Pulley is better than either cast iron split pulleys or steel split pulleys for the following reasons—

The wood pulley is lighter, stronger, better balanced, and provides a very much better belt surface. It costs 33 1-3% less money and provides 50% more returns in horse-power value. It may be run at very much higher speeds with no danger of bursting—also it may be had quicker and in a greater range of sizes.

It costs less to get—less to put on—and less to keep.

We make approximately 300 Dodge pulleys every day—everybody uses them.

There are more Dodge pulleys making ammunition than any other kind—you can get them quick.

Every pulley is thoroughly nailed. Every pulley is guaranteed for Double Belts.

We are Canada's greatest pulley makers.

If you have not our Books, write us.

Tighten the Grip of the Main Belt

This cork inset pulley—in every other respect exactly like the standard, smooth-faced American Steel Split Pulley—insures absolute grip at that "one time out of a thousand" when other pulleys *might* slip.

It is made to take the load of the main drive belt and transmit *all of it*. So the cork insets are put in. They *hold* the belt. It *can't* slip. The belt would tear first.

The insets will wear almost as long as the pulley.

These pulleys have been on the market several years, and we don't know of any that have actually *worn out* in service.

AMERICAN STEEL SPLIT PULLEY with Cork Insets

Over 60,000 pulleys—3 inches to 120 inches in diameter—stocked at centres named below, and additional thousands stocked by over 200 dealers insure prompt deliveries. Write for quotations and delivery dates.

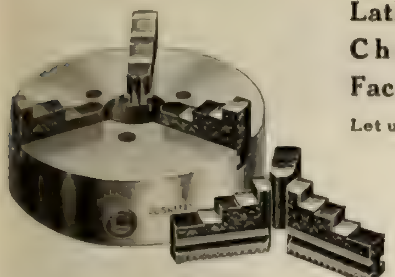
Cushman Chucks



Lathe Chucks, Drill Chucks, Portable Face Plate Jaws.

Let us send you our catalog.

The Cushman Chuck Co.

Hartford, Conn., U.S.A.

The Garvin Machine Co.

Manufacturers of

Milling Machines; Profiling Machines; Cam Cutting Machines; Screw Machines; Monitor Lathes; Die Slotting Machines; Screw Slotters; Tapping Machines; Duplex Horizontal Drills; Gang Drill Presses; Four-Head Right-Angle Drills; Wrenchless Chucks; Spring Coilers; Cutter Grinding Machines; Surface Grinders; Hole Grinders; Hand Lathes and Special Machinery.

We Want All To Have Our Catalog—Send For It To-day.

Spring and Varick Streets, New York City, U.S.A.

For Hardness Testing

THE PYROSCOPE

in shop and laboratory use the

Standard Scleroscope

Universally adopted; direct reading; inexpensive, and the only instrument that agrees with others of its kind in all parts of the World, thus solving problems of ordering materials to specification.

BOOKLET FREE.

THE SCLEROSCOPE (Set)

Heat Indication

by optical means is fast becoming the correct thing. The PYROSCOPE has solved the problem. Perfect constancy, inexpensive, no electricity used. Built to stand rough usage and upon common-sense lines. Used by the Government and best firms.

Shore Instrument & Mfg. Co. 555-7 W. 22nd St. New York

Agents for Canada: A. R. Williams Machy. Co., Ltd., Toronto, Can.

IS YOUR RIVETING PROFITABLY DONE?

Our Elastic Rotary Blow Riveting Machine does profitable work, because one machine will do the work of several hand riveters, and do it better.

Every head is perfectly formed, any shape, round, flat, oval, rectangular, etc.

Catalogue C tells more about it.

The F. B. SHUSTER COMPANY

New Haven, Conn.

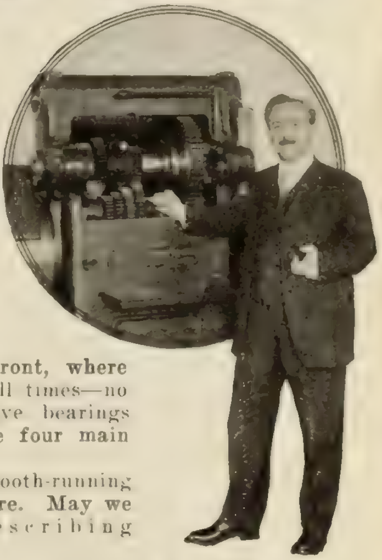
Formerly John Adt & Son. Established 1866

Also makers of Wire Straighteners and Cutter, Cotter Pin Machines, etc.

Power is a Feature of B. & S. Heavy Service Milling Machines.

See that Wide Belt on a Big, Well Supported Pulley

That means plenty of power delivered to the machines. On the machine shown below this is a 20-inch pulley driven at 320 R.P.M. by a 7-inch belt. Such high belt speed, powerful driving leverage, and wide belt contact results in a drive that pulls and pulls hard. That massive outer support and three long bearings in the frame keep the driving shaft from springing.



Then Notice the Powerful Spindle Gears

To get this power to the spindle it is transmitted through coarse pitch, hardened steel spindle gears, none of which are in mesh except those doing work. See the wide face, large diameter driving gear located right at the front, where power is delivered at all times—no spindle torsion. Massive bearings are placed close to the four main gears.

Now the efficient, smooth-running drive is only one feature. May we send you literature describing others?

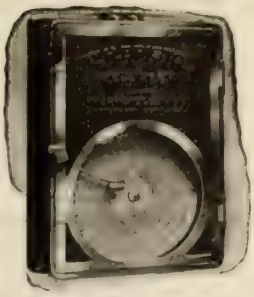
328 KNOWLTON ST., BRIDGEPORT, CONN., U.S.A.
NEW YORK, U.S.A., 248 CANAL ST.

Modern Heat Treatment of Steel Requires the Use of Pyrometers



The present cost of high-speed steel should mean the greatest care in heat treatment. Guesswork should be eliminated.

BRISTOL'S

Recording Pyrometers

Give the superintendent or manager a check or permanent record of the temperature during certain processes. Write for full information and Bulletin I-205.

THE BRISTOL CO., Waterbury, Conn., U.S.A.

Branch Offices:
Boston, New York, Pittsburgh, Chicago, San Francisco

If YOU are Making SHRAPNEL

You need a

TWINKO

Indicating or Recording PYROMETER

It will insure the metal being treated at the right temperature. Don't take any risks.

Write for Bulletins Nos. 6 and 7.

The woods are full of them

Judges have been numerous in Canada who have come down off the bench to lead the people—who have stooped to conquer, as it were—Blake, Mowat, Thompson, Meredith. And so there is plenty of precedent for a move which is being talked of in the Liberal party—the grooming of Mr. Justice Duff for the leadership of the party against the day when Sir Wilfrid Laurier will seek his ease. Mr. Justice Duff is a member of the Supreme Court of Canada, but it is said that, should the boom in his favor reach a sufficient volume, he will be willing to step down from the bench and get into the fight.

This makes the basis for an extremely interesting article by H. F. Gadsby in the September issue of MacLean's Magazine. Mr. Gadsby discusses the Duff boom in a thoroughly impartial way, and tells something of the young Judge who may be slated for so high an honor.

"The Duff Boom" is but one of many features in the September MacLean's. The number bristles with bright stories and powerful articles by such clever and famous contributors as Arthur Stringer, Agnes C. Laut, Robert W. Service, Arthur E. McFarlane, Alan Sullivan, Mrs. Arthur Murphy (Janey Canuck) and many others. It is Canadian from cover to cover—the best reading obtainable on this side of the border.

Now on sale at all News Stands, 15c.

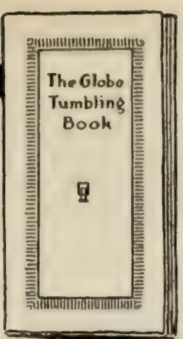
GET YOURS



If you do—or intend to do Tumbling you should have this practical treatise.

It is the result of ten years' experience with Tumbling methods and barrels—and contains many helpful hints.

The man responsible for results in your Tumbling Room may find it instructive.

Your **free** copy is awaiting your call. Mention Canadian Machinery.

THE GLOBE MACHINE & STAMPING CO.
CLEVELAND, OHIO

BE READY

If you wish to take advantage of the extensive "Made in Canada" campaign, prepare to meet competition by consulting our expert engineer for the manufacturing of your special machinery.

LYMBURNER, LIMITED
Commissioner and Berri Sts., Montreal
CANADA

WE MANUFACTURE

Special Machinery, Tools and Gauges for the manufacture of Munitions.

WE MAKE TO ORDER

Special Machinery for any purpose.
Gauges, Tools, Cut Gears, Molds for rubber, Etc., Etc.

BROWN ENGINEERING CORPORATION, Limited
415-419 King St. W., TORONTO, Ont.

C.T.S.

Cab Tyre Sheathing Cable

For Electric Tools and Portable Lamps

This cable cannot be excelled for trailing purposes—it is just in its element where there is abuse and severe usage.
Get acquainted and you'll always use it.
Send in a trial order.

Hendey Experimental 12" Lathe

For the Laboratory or Experimental Department where the best of its kind is wanted, and each machine must be motor-driven, here is the Lathe in this HENDEY 12".

In addition to its complete regular equipment it has Small Tool Cabinet for operators' fine tools, also gear closet for extra gears to cut special threads.

Write for Descriptive Matter.

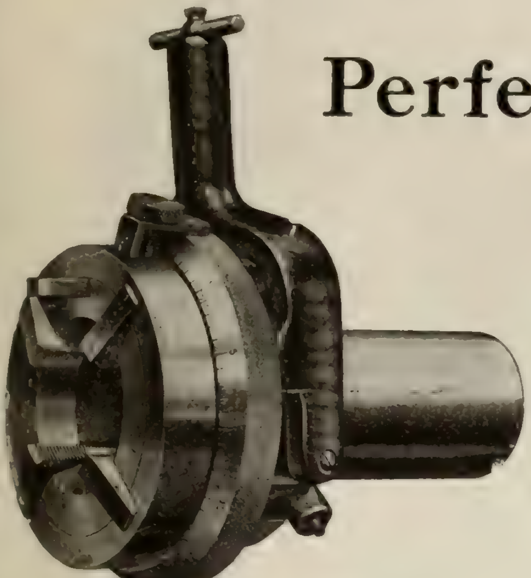
Wells Self-Opening Dies

CUT

Perfect Screw Threads



WELLS SELF-OPENING DIE
has both face and hand trip.

The Wells Self-Opening Die cuts the thread with a fine shearing cut, then opens with a quick, positive snap.

Adaptability

The Wells Self-Opening Die can be used on screw machines, lathes, automatics, drill presses and bolt cutters.

Chaser Principle

The Wells Self-Opening Die embodies an entirely new principle of design. The chasers are about four times as long as the threaded portions and are supported throughout their entire length and width by the solid sides of the slots in the body. They cannot squirm away from the work. Wear is reduced to a minimum throughout. Adjustment is simple, positive and accurate.

A large number of these Dies in Stock for immediate shipment.

HEAVY SHELL LATHES

Limited Quantity for Immediate Delivery

These lathes are particularly adapted for the minor operations on all large shells, and all operations on smaller shells up to 5 in., with the application of various attachments, which we can supply. Ideal machines for rough and finish turning.

Greater efficiency and speed will be secured by the use of machines adapted for each particular operation.

These machines as now manufactured embody many improvements over the first lot of lathes made.

Full Specifications on application.

Manufacturing Cartridge Cases for 18 Pounder Shrapnel and 4.5 in. H.E. Shells

Staff Article

Not the least important among the many successes achieved by Canadian metal-working plants in the matter of munitions production has been that of the brass cartridge cases required for 18-pdr. shrapnel and the smaller high explosive shells. The output of cartridge cases has steadily developed in quantity, so much so, that in spite of the fact that comparatively few plants are so engaged, it is possible to now keep pace with the production of the corresponding steel projectiles to which the cartridge cases are a necessary supplement.

THIS plant, which is turning out approximately fourteen to fifteen thousand 18 pdr. shrapnel or 4.5 in. H.E. shell brass cartridge cases per day, receives the flat discs from several sources; and in order to keep a record on quality of output, these blanks are stored in separate bins, having the makers name attached, in order that faulty material may be traced back through the proper channels. These blanks, which are 6.22 inches in diameter, are punched out of rolled sheet brass, 0.380 inch thick. They are generally annealed at the makers mill, and are received at the case manufacturing plant in readiness for the first press operation.

Fig 1 shows a general view of the press department, those presses in the foreground being mechanically operated, central crank drawing units, and those, in the rear, of the heavy toggle type with the main mechanism located beneath the level of the floor. All of the presses are belt-driven from a line shaft overhead, one 75 horse power motor being used for the drawing presses, and three 75 horse power Westinghouse motors for the eight heading presses; the latter consisting of five-900 ton and three 1500 ton Ferracute toggle type products. A general idea of the shop layout will be had from Fig. 2.

First Operation—Cupping

After the blanks are received, the first operation is that of cupping, shown in Fig. 3. This is performed on two Ferracute presses, each one capable of producing from 7500 to 8000 cups a day of 22 hours. These presses are fitted with revolving turrets, so that, if necessary, the discs can be placed in position when clear of the punch; however, experience has shown that better results are obtained if the die is left permanently in a working position, as the possibilities of an operator being caught are comparatively slight, owing to the slow action of the moving ram. The cups are forced completely through the die, and are removed from below by another workman. A copious supply of lubricating material is automatically distributed to the punch and die, by an arrangement attached to the ram of the press and operated by its vertical movement, as shown in Fig. 5. The valve

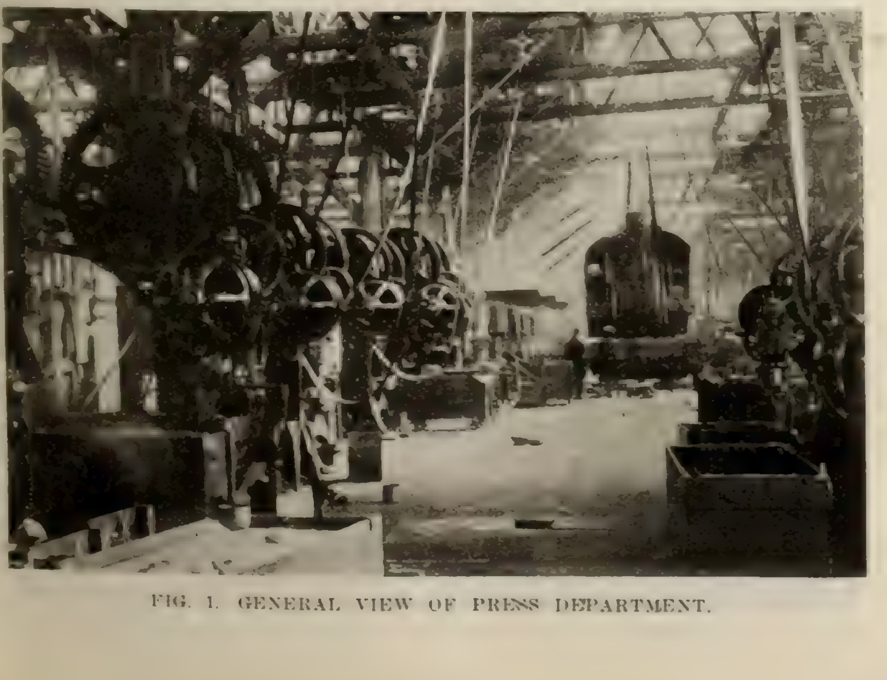

FIG. 1. GENERAL VIEW OF PRESS DEPARTMENT.

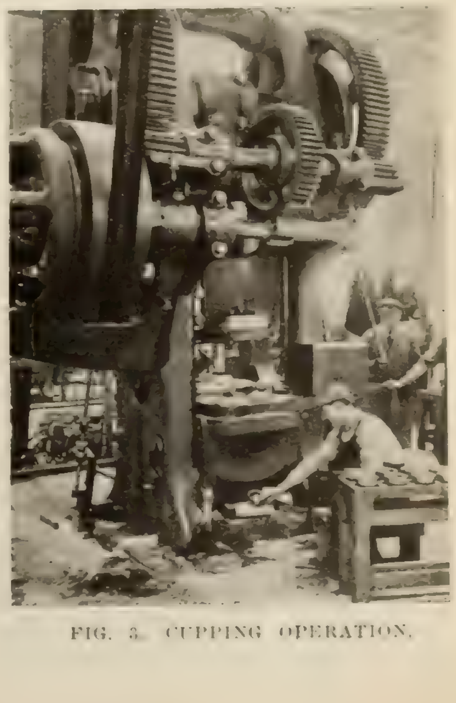

FIG. 3. CUPPING OPERATION.

A is secured to the ram and is controlled by the position of the handle B, which is in the position shown when press is operating, but the spring C causes the valve to close when the ram is at the top of its stroke. The lubricant is supplied from a tank overhead, through the hose F, and fed to the work through the pipe E. The drawn cup has an inside diameter of 3.99 inches, outside diameter of 4.544 inches, and a depth of 2¼ inches.

Annealing the Cases

Owing to the drawing process hardening the metal, it is necessary to anneal the partly finished cases previous to each re-drawing operation. This is essential to restore the metal to the required ductility, in order to obtain satisfactory results. The cups are placed in large perforated, sheet steel boxes, which are placed on steel frame trucks, having several rollers on the upper surface to aid in transferring the boxes to and from the furnace chamber, which is also fitted with rollers throughout its entire length. At intervals of about six minutes, the charging door of the furnace is opened, and by the action of a pneumatically operated ram, the crate is shoved into the furnace. By means of a system of pulleys and shafts, operated from an air cylinder, both front and

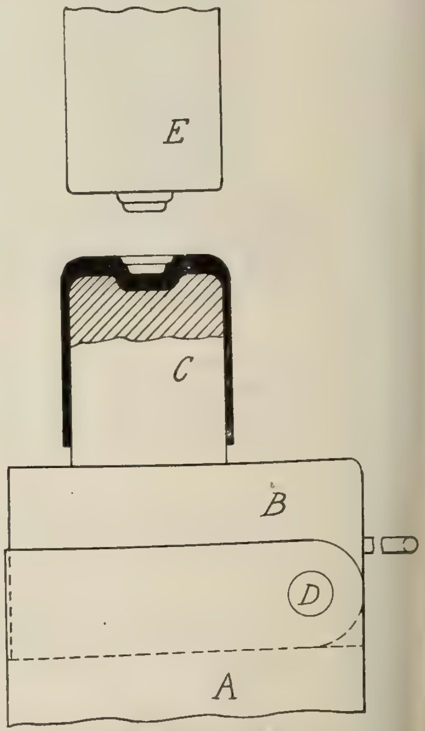

FIG. 6. SWIVEL BLOCK FOR INDENTING.

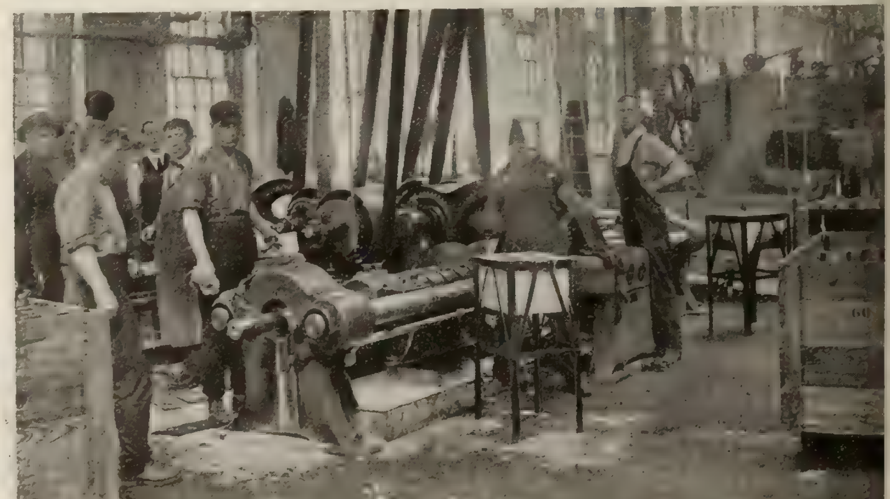

FIG. 6a. FIFTH AND SIXTH DRAWING OPERATION ON HORIZONTAL SCREW PRESS

rear doors of the furnace are controlled simultaneously, so that as one crate of cold cases enters at one end, a fully heated lot is discharged at the opposite end. This crate, which has been in the furnace for about 40 minutes and has attained a temperature of approximately 1200 degrees F., is placed upon a specially constructed roller platform, that is lowered into a water cooling bath. Several immersions are made before the pieces are sufficiently cool to be handled. Running water is used, being pumped from a nearby canal.

After cooling, the cases are placed in wooden boxes in such a position that the pickling solution will have free access to the entire surface, and yet drain easily when raised from the bath. The pickling solution consists of a weak solution of sulphuric acid (about 20 to 1). The pieces are allowed to remain in the bath for several minutes, and are then immersed in a caustic soda bath and afterwards thoroughly washed in warm water to remove all traces of acid.

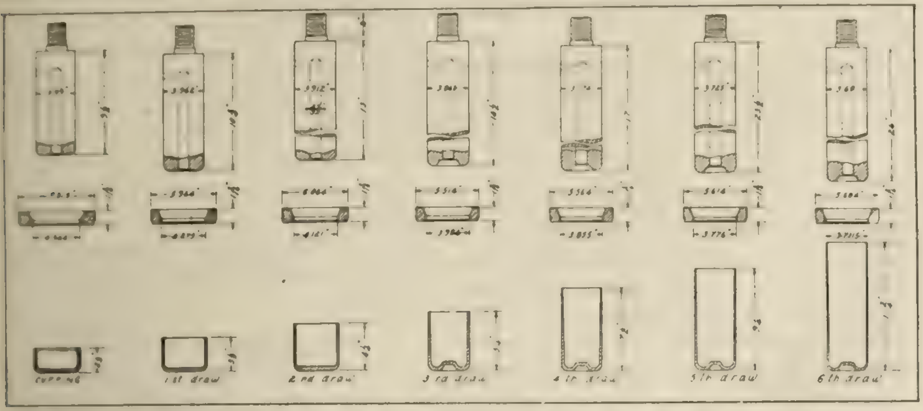

FIG. 7. PUNCHES AND DIES FOR CUPPING AND DRAWING OPERATIONS, 18 PDR. SHRAPNEL SHELL CARTRIDGE CASES.

While some authorities contend that water cooling affects the physical properties of the brass, it is the process generally adopted by cartridge case manufacturers, the very best of results being obtained.

First Redrawing Operation

The first redrawing operation is accomplished on Ferracute presses. The latter operates continuously, the workman placing the cups in the disc as the ram ascends. In all instances, the pieces are forced through the die, falling out below. The dimensions of the case after the first draw show an inside diameter of 3.962 inches, outside diameter of 4.275 inches, and a height of about 3⅛ inches. Two Ferracute presses are working on this draw, each with a capacity of from 380 to 400 an hour. The cases are again annealed, going through the same process as already described, and are then taken to the second re-drawing operation, which is similar to the first in every respect. The finished dimensions of the case are now 3.912 inches inside diameter, 4.121 inches outside diameter, with a height of 4¼ inches.

First Indenting and Third Draw

Before going to the annealing furnaces, again, the cases receive their first indent. This is accomplished on a single acting Ferracute press, one such being sufficient to handle the output of the shop. Two men are engaged in its operation, one removing the finished piece as the other places the next one on the post and operates the swinging block. The press runs continuously, an indent being made at every other stroke. Fig. 6 is a sketch of the tilting post used when indenting the head. The post A is secured to the base of the press, and the block B which carries the post C is fitted in the slot and tilts on the pin D; the punch E is secured to the moveable ram. Following indenting, the cases are again annealed and taken to the third re-drawing press, where they are drawn to a length of 5¼ inches, with an outside diameter of 3.984 inches and an inside diameter at the mouth of 3.843 inches, the punch being slightly tapered to leave the wall a little thicker near the head. Two Ferracute presses, with

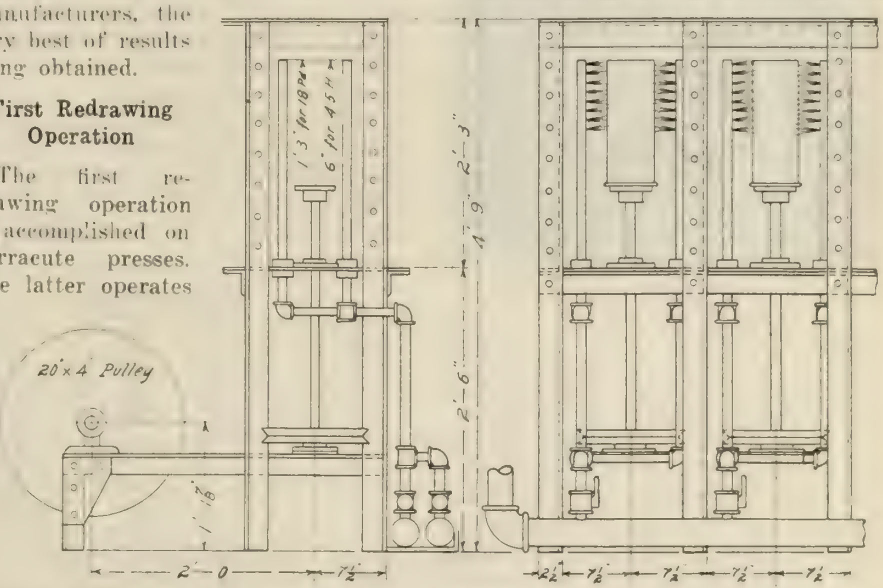

FIG. 9. PART ELEVATION OF CARTRIDGE CASE MOUTH ANNEALING FURNACE.

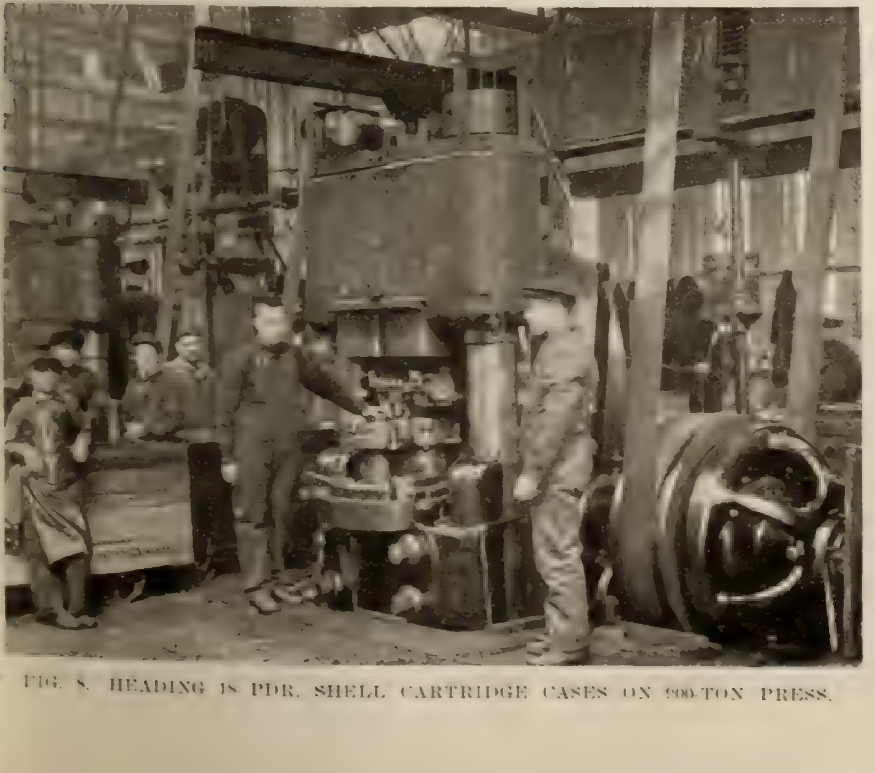

FIG. 8. HEADING 18 PDR. SHELL CARTRIDGE CASES ON 900-TON PRESS.

similar capacity to that of the previous operations, are used on this draw.

Fourth Draw and Second Indent

The cases are again annealed and taken to the fourth draw, where they are brought to a length of 7½ inches and an outside diameter of 3.855 inches, with walls 0.042 inch thick at the mouth, and tapering to about 0.077 inch near the head. Owing to the increasing length, three presses are required on this draw, the capacity of each being about 5,000 per day of 22 hours. The second indent follows, being really a repetition of the first, and being performed on a Ferracute press in like manner to that already described. To facilitate further operations, a small 5-16 inch hole is punched through the centre of the indent to permit the free passage of air, as the punch enters and leaves the case. If this condition was not provided for, the trapped air would seriously affect the drawing operation. The cases are again annealed before passing to the fifth draw.

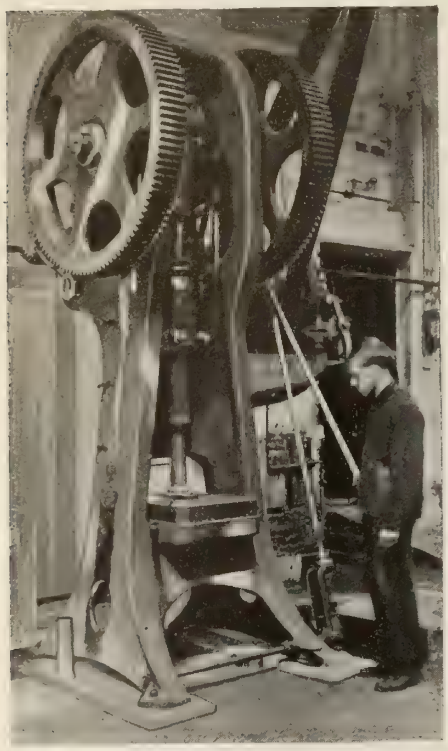

FIG. 10. TAPERING 18-PDR. SHELL CARTRIDGE CASES.

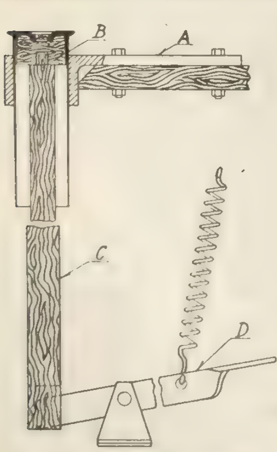

FIG 11. DEVICE FOR RETAPPING CASES.

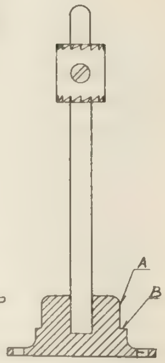

FIG. 12. TOOL FOR FACING INSIDE OF INDENT.

Fifth Draw and Preliminary Trimming

Owing to the extreme length, the fifth and sixth draws cannot very well be performed on a crank press, and for this reason other means are necessary. This plant has two large Bliss presses, the rams of which are operated by a rack and pinion, the length of the stroke being adjustable and the action controlled in the same manner as a belt driven planer. These two presses operating on the fifth draw have a capacity of about 220 per hour each. In addition, there are four large horizontal, double ended Ferracute screw presses, working on the fifth and sixth draws. The dimensions after the fifth draw show an outside diameter of 3.776 inches, with a tapering inside diameter; the mouth being 3.725 inches. The length is roughly 9¼ inches. Following this draw, the cases are trimmed to a length of 9 inches on a Blount lathe fitted with a special trimming attachment. Two men are employed on this operation, one taking off and trimming while the other places the cases on the arbor; the work being accomplished as fast as the men can handle the case.

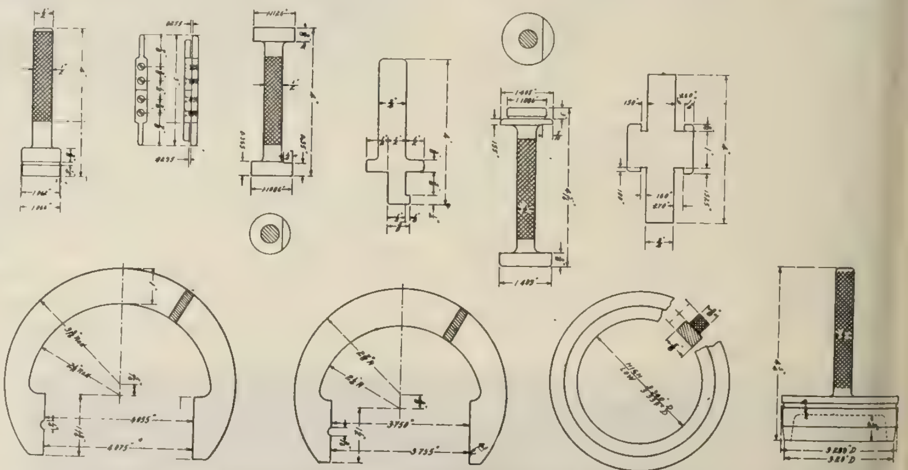

FIG. 13. SOME OF THE MORE IMPORTANT GAUGES FOR 18 PDR. SHELL CARTRIDGE CASES.

Final Annealing and Sixth Draw

The cases now pass through the annealing furnace for the last time, and are then taken to the horizontal presses, shown in Fig. 6a. These presses are of the double-ended type, the cross-head which holds the punch being secured to either end of a central shaft, which is operated by a coarse pitch groove running along the whole length, the nut being secured in the bore of the main driving gear located in the centre of the press. The action of the punches is under automatic control, but to avoid any possibility of accident, an operator, is placed in charge of the reversing lever. These presses operate at about six strokes per minute. A continuous flow of lubricant is supplied to the cases directly above and in front of the drawing die. This solution is pumped up from a central well, located below the floor, to a large tank overhead, from which it flows by gravity to the various machines. The dimensions after the final drawing operation show an approximate length of 12½ inches, an outside diameter of 3.7315 inches, and inside diameter, at the mouth of 3.680 inches, tapering to 3.635 inches near the head end.

Final Trimming and Heading

The cases are now trimmed to a length of 11¾ inches. In Fig. 7 is shown the various draws with their respective punches and dies. The next operation, that of heading is shown in Fig. 8. This process is accomplished on several 900 ton mechanically operated Ferracute toggle presses. A turret is provided having two sets of case holders, one for flattening and the other for final heading. Three men are in attendance, one operating the press and removing th case, while another places the next cas on the post and revolves the turret; th third operator receives the cases an places them in crates. The headed c is mechanically ejected by rods a levers controlled from below the mo able ram. The turret rides on a hea spring and ball bearing to facilit operation.

Mouth Annealing and Tapering

Before the tapering can be procee with, it is necessary to anneal the up portion of the case, to allow of diameter being reduced without bul ing the stock. The furnace employed this purpose (a section of whic is shown in Fig. 9), holds six ca s, the time required to heat the mout of the latter to the desired tempera re being from ½ to ¾ of a minute. To insure uniform heating, which is a so-lutely necessary, the case rests up revolving post which permits the gas flames to play evenly upon the exposed surface.

To complete the tapering of the case requires two operations. The first reduces the mouth to a diameter of 3.34 inches, the length of the taper being about 7 inches. The final tapering leaves the mouth parallel for a little over an inch, with a gradual taper of 0.04066 inch throughout the remainder of its length. Three Ferracute presses (one of which is shown in Fig. 10), take care of this feature, one exclusively on each operation, with the third alternating between the first and final tapering. A knockout is provided to strip the case from the upper die. When buckling occurs, the case is carefully examined, and if defects are found to have been in the metal, new discs are supplied by the maker. However, many other reasons, such as uneven annealing, slight imperfections in the walls of the case, due to defects in the drawing dies or punches, etc., may cause trouble in the tapering operations; therefore, in order to reduce the possibility of spoiled cases, every one is carefully inspected after each machining operation, and if any fault is discovered, the cause is immediately eliminated.

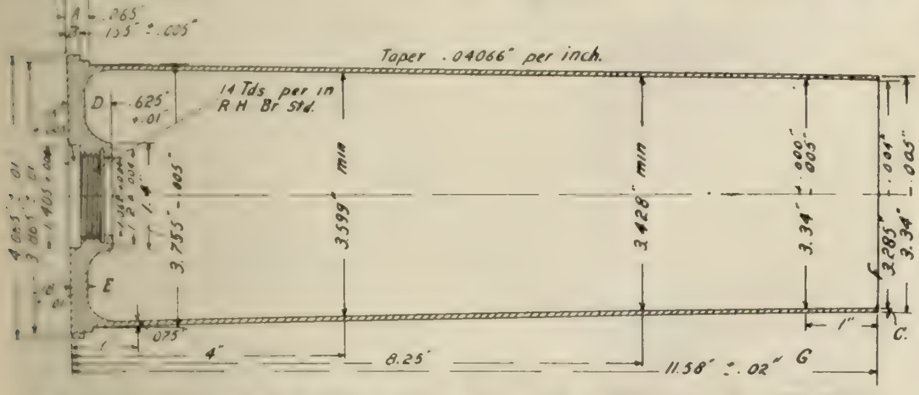

FIG. 14. DETAIL OF FINISHED 18 PDR. SHRAPNEL SHELL CARTRIDGE CASE.

Machining the Head and Mouth Ends

Machining the head is performed on a number of Bullard and C.M.C. special purpose lathes, fitted with a turret, also with facing and mouth boring attachments. The operations on the head are drilling, recessing, facing and turning [illegible], tapping with a Murchey collapsible tap and reaming. At the same setting the open end of the case is faced (from the rear), and the mouth bored parallel to a diameter of 3.285 inches, with an allowable variation, above or below of 0.004 inch. Each machine has a capacity of from 50 to 60 an hour, dependent upon the speed of the operator, and the condition of the tools. An output of 70 an hour has been maintained on various occasions; this with a second operator working on the mouth while the other finishes the head.

Hand Tapping and Rectifying

To maintain the highest degree of accuracy, the thread in the head is tapped by hand with a special sizing tap, the average life of which is about 300 holes. The device used for holding and lifting the cases is shown in Fig. 11. The bracket A, which is bored out to fit the taper of the case, is secured firmly to the bench, the case being held by friction only. When the hole is tapped, the case is forced up by the depression of the treadle D. The block B is made of hardwood, and shaped to fit the inner contour of the case head. The piece C is made of hardwood, 2½ inches square, the upper portion being turned to a diameter of 2¼ inches. The inner surface of the indent is faced off by a tool similar to that shown in Fig. 12. Minor defects are removed from the interior by scraping, and on the outside by draw filing and polishing with emery cloth. The markings on the head are done on a single-acting press fitted with a swinging post similar to that shown in Fig. 6.

Scleroscope tests for hardness are made at various stages throughout the process of manufacture, and these readings must conform to specification. Every case is carefully inspected, not only by the shop inspectors during the progress of manufacture, but by Government inspectors after the cases are completed. Some of the more important gauges, and their applications are shown in Fig. 13.

4.5-in. Howitzer Cartridge Cases

The processes of manufacture on the 4.5-inch howitzer cartridge cases are very similar to those of the 18-pdr. shrapnel, an exception being that there is one less drawing operation. The heading operation requires a much heavier press, owing to the additional amount of metal to be worked. Before the ad-

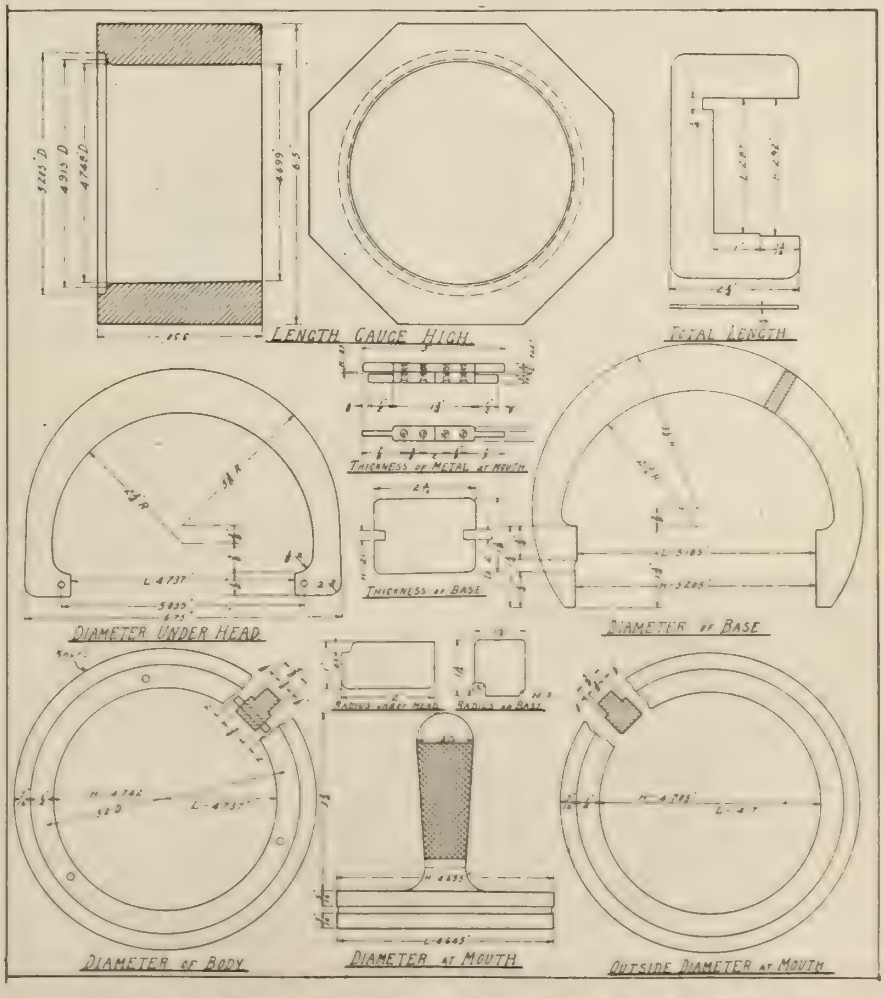

FIG. 15. SOME OF THE MORE IMPORTANT GAUGES FOR 4.5 IN. CARTRIDGE CASES.

vent of the large hydraulic presses, now employed on this operation, the plant here described had performed the heading on a powerful Bertram plate punch, fitted with special case heading equipment. Owing to the short length of the 4.5 cartridge cases, it is necessary to have a separate setting when machining the mouth end. The head is finished in a similar manner to that of the 18-pdr. cases, the machine tools employed consisting of special C.M.C. and Bullard lathes. Following this, the cases are taken to a number of small speed lathes fitted up with special chucks and cam attachments that allow of machining the mouths of the cases as fast as an operator can handle them. The rectifying and inspections are identical with those of the 18-pdr. cases.

An important factor in the manufacture of munitions is the handling of the scrap material, so as to prevent its locational accumulation. The scrap brass and copper in this particular plant are packed into blocks, 6 inches square by about a foot in length, this being procured through the medium of what is called a cabbage machine, made by the Longemann Machine Co., of Milwaukee, Wis. A 5-h.p. Westinghouse motor operates the hydraulic pumps in connection with the cabbage machine, a final pressure of about 2,300 pounds per sq. in. being both necessary and attainable.

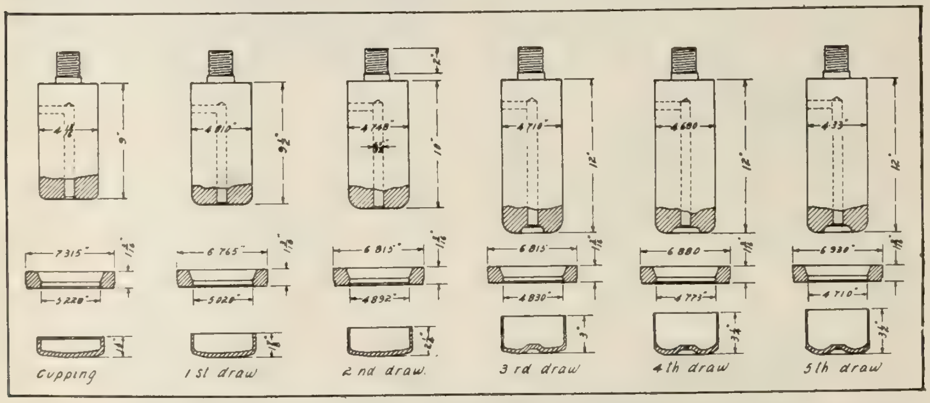

FIG. 16. PUNCHES AND DIES FOR CUPPING AND DRAWING OPERATIONS, 4.5 H.E. SHELL CARTRIDGE CASES.

INTENSIVE SHELL PRODUCTION

A LARGE contract for high explosive shells has just been completed by the Harrisburg Pipe & Pipe Bending Co., Harrisburg, Pa. The company, it is understood, established a new American high record for making projectiles per man and per lathe. It became necessary to stimulate production in the last few weeks to the highest attainable point in order that the contract should be completed by June 30, as any unexecuted portion was to be automatically cancelled if not completed by that time. Large bonuses on all shells made over a certain number were given to the workmen with this is view. The men produced 50 per cent. more shells than the company had thought possible from its equipment, but it stood by its agreement, although the bonuses paid were excessive, as they were only operative for a short time. According to the Iron and Coal Trades Review, the pay of one worker for one week, with his bonus, amounted to over $150, and a number of others made nearly $100 a week.

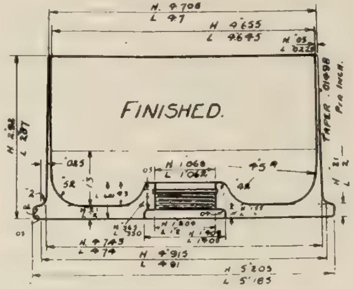

FIG. 17. FINISHED 4.5 IN. SHELL CARTRIDGE CASE.

COLLIERY GUIDE ROPE FRACTURE

A CASE of fracture in a colliery guide rope, which led to fatal results in a Scottish colliery, is calculated to afford matter for investigation by the metallurgist. The rope, which was made of steel strands, had been lengthened, the joints being welded into a solid mass of steel; the fracture occurred close to a weld. These ropes are exposed to numerous alternate bending strains in use, owing to the vibration of the cage, and it is possible that these had fatigued the metal at the plane of transition between the solid and the strand condition.

In the case of bicycle frames, it is well known that the inserting of lugs of uniform thickness weakens the tubes at the points opposite to where the liners end, but that this difficulty can be overcome by tapering the metal of the liners and, by allowing this metal to give a little under stress, increasing the tube area over which the strain is distributed. The Ironmonger states that possibly a similar effect might be obtained in the case of these rope welds by a tubular sheathing, extending a short distance beyond the solid mass of the weld.

ROPE DRIVE ADVANTAGES

I AM inclined to favor a rope drive in preference to a belt when the belt to be replaced is over 12 inches in width, says a writer in the Paper Trade Journal. Having had experience with both, he finds that the rope drive is much better than the belt. There are several advantages claimed by installing a rope drive

1.—It is economical; the drive bein cheaper to install than that by leathe belting.

2.—The ease by which the power i transmitted to any distance or in an direction.

3.—There is less loss by slipping.

A single rope is carried round th pulley as many times as is necessary t produce the required tractive effor while the necessary tension is obtaine by passing the rope around a tensi pulley weighted to give the desir strain.

The ropes used in rope transmissi are of hemp, Manila, or cotton. Mani ropes are perhaps mostly employed.

The breaking strength of the ro varies from 7,000 to 12,000 pounds p square inch in cross section, and t average value may be taken as 700 when D is the diameter of the rope inches. The weight of ordinary Man or cotton rope is about .3D pounds foot of length. For continuous tra mission, it has been determined by periment, that the best results are tained when the tension on the driv side of the rope is about 1/35 of breaking strength. The ropes run in shaped grooves. The co-efficient of f tion for grooves with sides at an a of 45 degrees may be taken at from to .33. The formula for finding horse-power transmitted is as follo

$$H = \frac{xD^2}{825} \times \frac{200 - v^2}{107.2}$$

H—Horse-power transmitted.
D—Diameter of rope in inches.
v—Velocity of rope in feet per se

The greatest tractive effort is ob ed at a speed of about 84 feet per ond. For higher velocities, the ce fugal force becomes so great that effort is decreased; therefore, a should not run faster than about feet per minute, and it would pe be better to limit the velocity to feet per minute.

Rope pulleys differ from belt p only in their rims. The inclinati the sides of the grooves may vary 30° to 60°. The more acute the the greater the coefficient of frictio an consequent wear on the rope. The am eter of a rope pulley should be at lea 30 times the diameter of the rope. he possible, the lower side of the rop should be the driving side, for i tha case the rope embraces a greater p tion of the pulley.

MACHINISTS' INSTRUCTION COURSE—II.

By J. Davies.

THE drilling machine is a real necessity to every machine shop, although its chief work is to make holes, yet it can be used for a variety of other jobs, such as tapping, reaming, facing, boring, etc. There are many varieties of drilling machines, but we can consider them in two classes, those in which the drill is moved to suit the work, termed radials, and those in which the work must be moved to suit the drill, [illegible] by moving the table and the work [illegible] or by moving the job alone.

In setting up a job such as a cylinder [illegible] flange or anything with a [illegible] of holes in it on a radial drill [illegible] to try if the drill will reach [illegible] hole, before finally bolting down [illegible] the drill table. Make it a rule to [illegible] reset any job on any machine, [illegible] you are satisfied that it cannot [illegible] be done at one setting. The [illegible] of a drilling machine should be at [illegible] angles or square to the drill spindle, and before starting on an important job you may want to know that it is square to the drill spindle.

The best method by which to test the machine is as follows: Put a fairly stiff taper shank boring bar in the drill spindle, through one of the slots in the boring bar put a piece of flat iron, long enough to reach to the outer edge of the table, and have the blacksmith draw out one end of the flat bar and turn down like a caliper leg to serve as a pointer. Fasten the flat iron in boring bar with a key or a set screw, lower the drill spindle until the pointer nearly touches the table, then pull the drill round by hand and try the table at four different places. It is best not to let the pointer touch the table as the spring on the pointer might fool you; cut some slips of paper and use them for feelers lowering your pointer until you can feel it touching the paper.

If your pointer touches the paper the same way at the four opposite places, the table is accurate; if the table is found to be inaccurate and there is no means of adjusting it, note which is the low side of the table and allow for it in setting up your work. You will find this pointer a very useful tool in setting up work in which the holes must be drilled at right angles to a given surface on a piece of work.

The best and most frequently used drill for ordinary work is the twist drill, which is probably the most efficient tool found in the workshop to-day. It is formed by cutting spiral grooves in a round piece of tool steel, and has a cone shaped end on which suitable cutting edges are formed. Drills taper very slightly being biggest at the cutting end, this is to provide clearance in deep holes and prevent the drill choking in the hole. They also have what is called body clearance, that is part of the surface is cut away a short distance from the cutting edge back to the flute, thus reducing the friction between the drill and the sides of the hole, as without this body clearance the drill would soon get hot and become soft to a degree that would make it useless for further use. See Fig. 8.

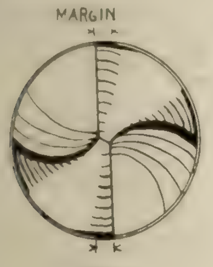

FIG. 8.

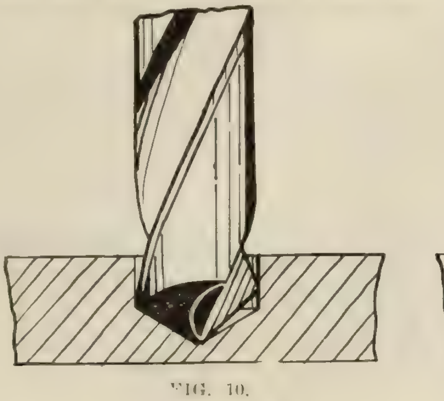

FIG. 10.

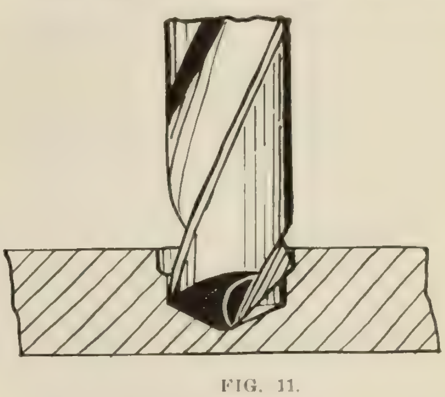

FIG. 11.

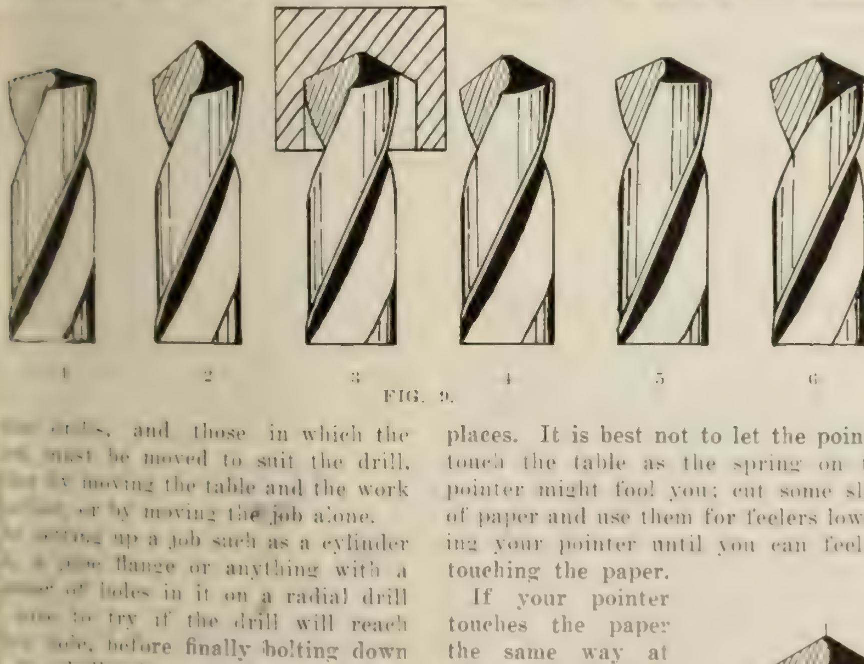

FIG. 9.

Drill grinding is a very important thing for every apprentice to learn, as the result of drilling machine work depends largely upon the condition of the drill. No amount of instruction without actual practice and experience can make any one proficient in this art; all that can be done on paper is to point out ideal conditions and the results of inaccurate grinding of the cutting edges.

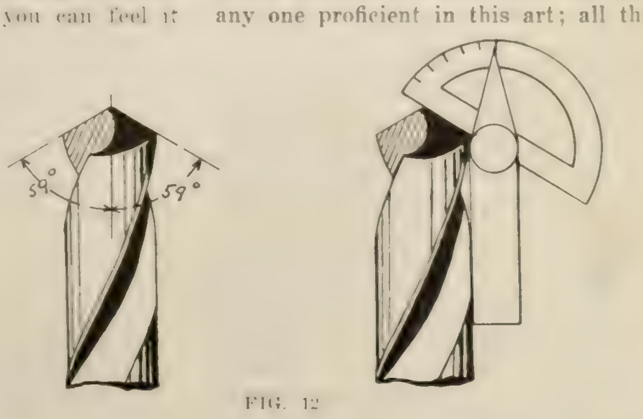

FIG. 12

There are at least seven wrong ways of grinding to say nothing of a few original methods of every apprentice: (1) Too flat; (2) Too sharp; (3) Unequal cutting edges; (4) Unequal angles; (5) No lip clearance; (6) Too much lip clearance; (7) Unequal lip clearance. See Fig. 9.

1. The result of grinding too flat forms a hook-like cutting edge and it is very hard to get a round hole. The drill ground in this manner is very apt to get away from the centre punch mark, and must be watched very closely.

2. Too sharp a point puts unnecessary strain upon the machine and if you happen to be drilling thin plates, the drill point comes through the plate before the full size of the drill is entered into the metal, this allows the drill to wobble all over the job and causes a very irregular shape hole.

3. Unequal lengths of the cutting edge form a serious defect as this results in the hole being too large, although sometimes the fact of a drill possessing equal angles and one cutting edge longer than the other, can be turned to advantage, as in a case where you want a hole just a shade larger than the drill, or between the sizes of standard drills, otherwise, as it often happens especially in a small shop, you will have to use a drill with the margin considerably worn. Wear on the margin or land in Fig. 8 leaves the drill without sufficient clearance, so that it is apt to bind in the hole, and also drill a little small. In a case of this kind it is a distinct advantage to grind one cutting edge longer than the other.

4. If the point of the drill is in the centre but the angles of the cutting edge different all the work will be done by one cutting edge, and the drill will be crowded over to one side, which has a tendency to bind the drill, also make the hole too large. See Fig. 10.

When both the angle and the length of cutting edges are wrong it is impossible for the drill to give anything like satisfaction, it will be working under the very bad conditions shown in sketch Fig. 11. The support which a properly ground drill receives from the metal being drilled is entirely lacking.

5. If the drill has no clearance it simply will not cut and any attempt to make it cut by force will only end in disaster, usually by splitting the drill up the web. On the other hand if the drill has too much clearance it is liable to dig into the work and become loose in the drill socket. If you are using a straight shank drill, it would most likely slip around in the drill chuck and the edges also will keep breaking away because there is not sufficient metal behind them to support the edge.

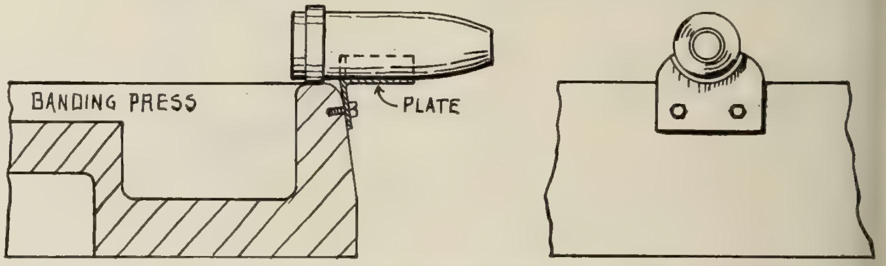
As the drill becomes shorter the centre becomes thicker, because the web of the drill is made thicker towards the shank to give the drill strength. To overcome this thin the edges taking care to keep the point central. The three main features to aim at in grinding drills are: (1) equal lengths; (2) equal angles; (3) proper clearance. The angle recommended by most drill makers is 59 degrees on each side as shown in Fig. 12.

* * *

ATTACHMENT FOR SHELL BANDING PRESS.

By John S. Watts.

THE sketch shows a rest for attaching to the side of banding press, which forms a convenient place whereon to rest the shell while hammering the band into the groove in the shell. It is necessary to give the band a blow or two with a hand hammer to set it into its groove so that it will stay in position on the shell when the shell is stood in place on the press.



ATTACHMENT FOR SHELL BANDING PRESS.

The rest is simply a piece of steel plate bent to the shape shown and secured to the side of the banding press with two cap screws in the position shown in sketch. The shell can then be laid on this rest while hammering the band into position.

ACTIONS IN EMERGENCIES

By J. Hamilton.

WHAT a person would actually do in a case of emergency is a debatable question. We are all prone to believe that we would or could control our actions under certain conditions; but in many instances an exactly opposite effect has been the result. The reaction of the nerves, due to any sudden news or local disturbance, so affects the brain of the average person, that they are plunged into a state of semi-panic or bewilderment, with a temporary loss of thinking power; consequently, predetermined actions are forgotten, and we are forced to obey a power, over which we apparently have no control. The spirit is often willing, but the flesh is nearly always weak.

In a large factory some time ago the main belt from one of the motors broke, striking and destroying one of the water sprinklers. If the men in the shop had been told that this particular mishap was expected, they may or may not have acted differently, but what did occur was equally as sudden and complete as that of the breaking of the belt, wit
the subsequent distribution of dust an
flying water. Without a thought
what had happened, the entire gang
men, with the exception of the forema
stampeded for the doors, falling ov
themselves and others with the one o
ject of reaching the outside. Howeve
they were no sooner outside than t

"SHRINKING-IN" A SHAF

J. R. H.

AS the years roll by, we are const
adding to our store of knowledge
while casting about for useful fur
to occupy the vacant cells of our
storey, we sometimes fasten our
upon a unique object, which is of
material value, but serves the p
of showing to what extent some
require refurnishing, and some
furniture remodeling.

A few years ago I was en
shrinking a large cast iron collar
shaft. I had machined the pa
readiness for the shrinking ope ion.
and was heating the collar to pl
the shaft, when a young man w had
been doing fitter's work for eral
years came to watch the ope tion.
When the collar was sufficiently ted.

I placed it in position on the shaft and in a few moments it took hold. The man inquired if it was not possible to "shrink in" the shaft. Not grasping his meaning I asked what he meant, and he replied: would it not amount to the same thing to head the shaft instead of the collar? After a little explanation, he left me, taking with him a useful piece of furniture, which up till that time had been obscured by dust, and was probably blocking the passage to more efficient material.

If your brain is to be a storehouse, examine each piece as it goes in, to avoid accumulating a lot of junk, that in a short time may cover up or obscure some more useful material.

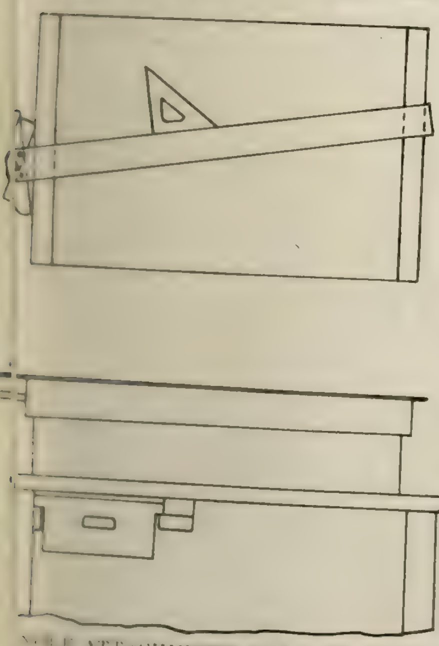
ANGLE ATTACHMENT FOR TEE-SQUARE

By H. M. F.

IT often happens when making drawings that certain parts of the object being drawn are located at an angle with other surfaces. With the tee-square used in the usual manner it is quite difficult to obtain these surfaces, as a protractor must be used which takes up considerable time. To overcome this difficulty a block may be fitted to the tee-square, as shown by the accompanying illustration. This consists of a knurled screw and a rectangular piece of wood, having the corner slightly rounded, which is placed on a tee-square in the manner illustrated.



ANGLE ATTACHMENTS FOR TEE-SQUARE.

To use this tee-square for drawing on an angle it is necessary to first locate on the line at the desired angle, after which, by swiveling the block until the tee-square matches this line, the remaining angular lines are drawn in the usual manner by sliding the tee-square up and down and using triangle.

MICROMETER DISCS FOR USE IN SETTING CALIPERS

By F. Scriber.

IT frequently happens in measuring work that micrometers handled in the usual manner do not adapt themselves very well to the condition, and in this case some other form of measuring must be resorted to.

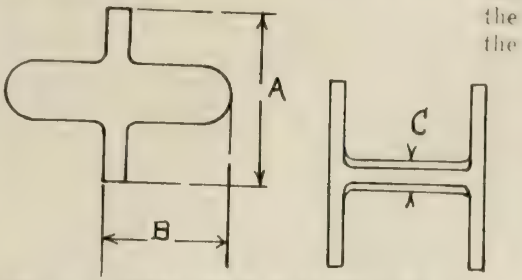


FIG. 1. ILLUSTRATING DIFFICULTIES IN MEASURING CERTAIN PARTS OF OBJECTS.

Two examples showing work of this nature are illustrated by Fig. 1, the conditions being obvious. In the diagram at the left the dimension A cannot be measured owing to the projection B interfering with the frame of the micrometers. In the diagram at the right it is necessary to measure at C, which is about two inches from the end of the part being measured, and likewise this is impossible with an ordinary micrometer.

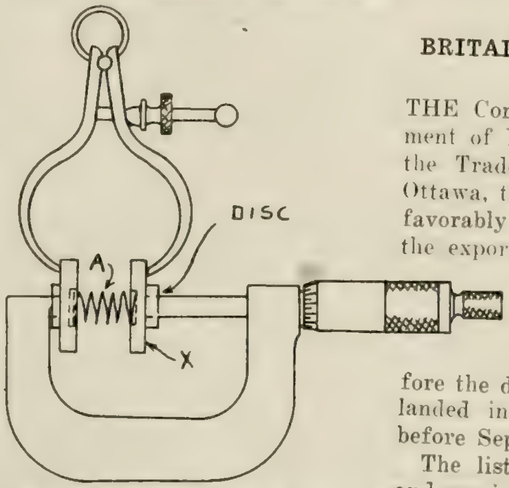

FIG. 2. METHOD OF USING DISCS ON A MICROMETER FOR SETTING OUTSIDE CALIPERS.

Recognizing this difficulty, a pair of discs, as illustrated in Figs. 2 and 3, are used in the following manner. Referring to the illustration, the discs are placed on the anvil and spindle of the micrometer, with a spring A to keep them in place. These discs have the surfaces X ground so that a reading taken from these surfaces will coincide with a reading taken in the usual manner without the discs. In using these discs a pair of ordinary spring calipers are set, as illustrated, using extreme care not to force the discs out of place; after this the work to be measured is calipered in the usual manner by the sensitiveness of the touch as the spring calipers are tried on the work.

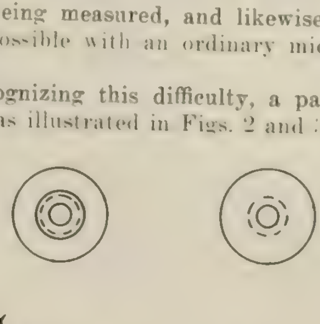

FIG. 3. TYPES OF DISCS FOR USE AS SHOWN IN FIG. 1.

A convenient pair of discs used for setting dividers is also shown in Fig. 3. In setting the dividers to these discs the point of the dividers are set to the groove Z. These two pairs of discs will be found very useful in getting around many of the odd jobs which present themselves in the day's work, and will greatly increase the usefulness of the micrometer caliper.

BRITAIN FAVORING CANADIAN EXPORTS

THE Controller of the British Department of Import Restriction has notified the Trade and Commerce Department, Ottawa, that he is prepared to consider favorably applications for licenses for the export to England from Canada of goods on the prohibited list. The condition attached, however, is that the goods in question were ordered before the date of the prohibition and are landed in the United Kingdom on or before September 15.

The list of prohibited goods is long and consists of goods whose importation is wholly restricted and others for which licenses must be obtained. The dates of prohibition vary from March 1 last to recent periods. Ivory, leather, paper, cardboard, sewing machines, furniture and many other such commodities are on the lists in question. Canadian exporters of such goods as pulp and paper, cardboard, furniture, etc., whose importation is allowed by license only, and is as a general rule restricted to two-thirds the normal consumption, are being favored as far as possible by the British authorities in the granting of these licenses, it is learned. It is a species of preference within the Empire.

* * *

Copies of the Canadian National Exhibition prize list may be obtained by writing Dr. J. O. Orr, general manager, Toronto.

The Toronto Board of Trade urged the C.N.E. directors to run the Fair for three weeks as far back as 1885, but the management thought two weeks quite long enough.

CONTEMPORARY WAR ARTICLES

Embracing Information and Data Drawn from a Variety of Sources Relative to and Arising from the Prosecution of this Many-Sided European War

MACHINING DEPARTMENT OF BRITISH NATIONAL SHELL PLANT

IN our August 17 issue through the courtesy of The Engineer, London, England, we were able to submit to our readers a racy though none the less interesting illustrated article covering the forging department of one of Britain's National Shell Manufacturing Plants. In the present instance, and from the like source, date and illustrations relative to the shell machining and finishing departments are featured.

Establishment.

About a mile distant from the forge department there is situated that in which the forgings are machined into finished shell cases. The history of this branch of the factory is one of the romances of the war. On August 30, 1915, the site was viewed for the first time. It was then under a crop of oats. On September 2, half a dozen workmen started operations. By October 6, all the foundations were in, but even before this, namely, on September 18 the erection of the columns had been begun, and this part of the work was completed by Christmas. The roof trusses followed, but bad weather came along, and it was not until the end of February that the glazing of the roofs was finished. The whole factory was completed by March 20, that is to say, everything down to the floors and the concrete foundations for the machines was ready.

FIG. 1. LAYOUT OF MACHINING DEPARTMENT, BRITISH NATIONAL SHELL PLANT.

Naturally the provision of the machines for the factory could not be accelerated beyond a certain limit, but as they arrived, section after section of the workshop was set going. Some of the machines arrived before the end of the year. Indeed, by January 12, that is to say, more than two months before the factory could be said to be complete as a building, twelve women were started on the machining of shells. The number of workers was increased to keep pace with the growth of the factory, those parts not completed being meanwhile screened off by boarding from those which were at work.

At first the operators worked on one shift lasting eight hours, but as more operators became available, a second and a third shift were started on April 12 and May 1 respectively. By the latter date a third of the factory was in full working order. On the date of the Engineer representative's visit, it was rapidly approaching its full contemplated staffing. In fact, it was then running from 6.30 on Monday mornings until 10.30 on Saturday nights, with breaks only for meals, and was increasing its staff at the rate of 100 per day.

Constructional Features

The factory, not counting the offices, mess-room and other adjuncts, covers an area of several acres. The ground was not level to begin with, and had to be filled in with ashes, in places up to a depth of 4 ft. Between two and three thousand tons of ashes were thus accounted for. The columns and roof trusses contain altogether about 1800 tons of steel, and there are about 400 tons of glass used in the roof. In addition, there were the galvanized iron sheets for the sides and all the details of the equipment to be reckoned with. Naturally one of the first problems to be faced was the connection of the chosen site with the nearest railway. A main line passed the works about 300 yards away, but, to get to this, the line had to be carried from the works across a main road and down a bank at an incline of 1 in 25. The line was started on September 6 and with all its connecting sidings inside the works was ready for use by November 18. Now that the work of erection is completed the line is used principally for the removal of the finished shells.

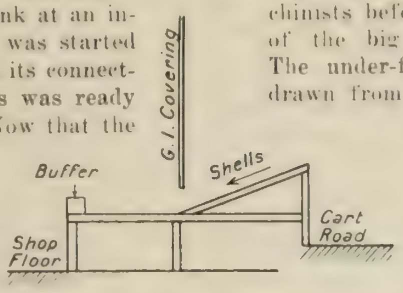

FIG. 2 ARRANGEMENT OF ROLLING WAY.

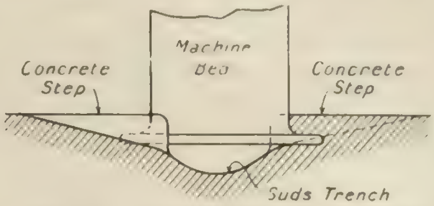

FIG. 3. ATTACHMENT OF MACHINE TOOLS TO FLOOR.

Training the Workers

So much for the material difficulties. The difficulty of getting suitable operators was no less great, and it was met with equal courage and energy. At a recent date the factory was employing 1725 girls and 314 men, the men being largely employed in setting up and keeping the machines in order. In fact it may be taken as correct that all the actual shell making and finishing was in charge of girls. The majority of the laborers, that is to say, those not occupied on the machining of shells but on such work as carrying the shells from one machine to another, were women. All this female labor had to be collected and passed as the works progressed.

By the principle of specialization explained in the forging article, the machine tool-makers have been able to supply machines which are readily operated and handled. In few cases is more than a month required in which to teach a future operator her work, and in many instances fourteen days is sufficient. The operators themselves, if properly trained, make excellent instructors.

All the workpeople have been trained by the firm in charge of the factory. This applies not only to the women but to the men in most cases. The superior foremen were mostly shell machinists before the war at one of the big armament works. The under-foremen have been drawn from many classes, and have been trained for their special work since the factory was started. A few skilled blacksmiths and tool fitters are employed. Such men, of course, required little or no training, as they were already qualified. A few male tool setters are to be found in the works. These men have been "lent" to the firm after having been trained, say, in a technical institution. At the factory they are principally employed to train women tool setters, who when proficient will take over the entire work of this nature. The total number of men employed at present is not at all great. As time goes on the number will decrease, while the number of women will rise. It is expected that ultimately the number of male employees will fall to something less than 5 per cent.

Lay-Out of the Factory

In Fig. 1 is shown a block plan of the factory. At the lower left-hand corner are the gates through which the steam wagons carrying the rough shells from the forge enter the works and at the top left-hand corner are the gates through which the machined shells pass out of the works in railway trucks. Between these gates, flanking the main road, are the offices. These are all on one floor. Their construction is interesting. The inside, outside, and partition walls are made entirely from cement slabs, 2 ft. square and $2\frac{1}{2}$ ins. thick. Primarily intended for sidewalk making, they form excellent building material, for they become dry and hard very quickly. They are cemented together along their edges, so that the walls everywhere are only $2\frac{1}{2}$ ins. thick. In addition to the cement, small steel U-shaped pieces are employed to bind each neighboring pair of slabs together. The inside and outside walls are stiffened at intervals of 29 ft. by pillars of reinforced concrete, and, on the outside, facing the road, the wall is rough cast.

The main factory extends to a considerable depth behind the offices. It may be described as consisting of numerous rows of steel columns, forming a corresponding number of manufacturing bays, each 18 ft. wide and provided with a pointed roof glazed on both slopes. The side walls are of galvanized iron. Three of the bays, namely, those numbered 20, 21 and 22, are given over to a blacksmiths' shop, where the tools used in the machines are forged and dressed; a grinding shop where the tools are ground to shape and sharpened after being forged; a tool room where repairs

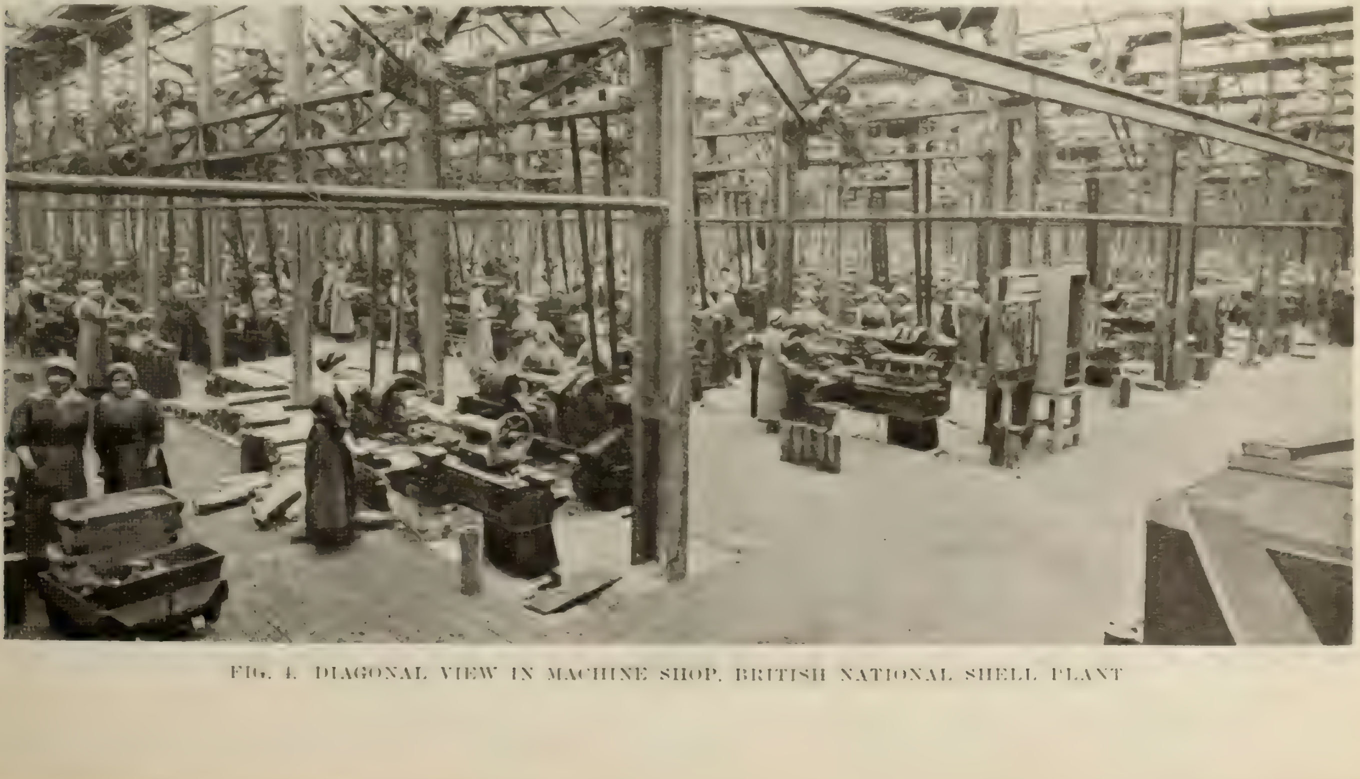

FIG. 4. DIAGONAL VIEW IN MACHINE SHOP, BRITISH NATIONAL SHELL PLANT

and equipment for the machines are carried out and produced, and a storeroom whence tools, oil and other details required by the operators are issued. The nineteenth bay is occupied by foremen's offices.

Although the blacksmiths' shop is surrounded, as it were, by the rest of the machinery, no inconvenience is experienced. The place of steam hammers has been taken by electrically-driven hammers using compressed air as the medium instead of steam. The smoke from the smiths' hearths is drawn by fans through overhead trunks and delivered through the roof.

Looking at the bottom of Fig. 1 where the incoming cart road is shown, it will be noted that opposite the four non-productive bays an annexe is provided as offices of the lady superintendent, her assistants and so on. In line with this annexe, and situated so that they may readily serve all the machine bays, are some rolling ways. These rolling ways are built-up structures of wood and greatly facilitate the passage of the forgings from the steam wagons to the inside of the works. The sketch—Fig. 2 will explain their construction. The galvanized iron sheeting which forms the side walls of the building is stopped short some distance above the level of the shop floor. The rolling way is built beneath, part inside and part outside. The outside edge of the rolling way is at such a level above the cart road surface that when the steam wagons come alongside and let down their side doors, the shells may be rolled right on to the incline, whence they travel by gravity down to the buffer inside the building. From the table within the wall, the operators can readily carry the shells to their machines as required.

Machine Tool Arrangement

The passage of the product within the factory is in a continuous straight line. Each bay may be said to be self-contained. If we pass down a bay, starting from the rolling way end, we will find that on either side of the central passage way is a row of machines, each one of which is different, and performs a different operation on the shell forging. A shell once taken from the rolling way into a particular bay remains in that bay and on one side of it until, having been passed from one quarter to the next, it emerges at the opposite end completely machined. Just as a sound system of lines of communications is required by an army, so, too, in a modern engineering factory, efficiency requires a sound system of distribution for the work. Crossing of the lines of communication in the one case and the lines of distribution in the other do not promote good output.

What we may call the lines of control of the factory are at right angles to the lines of distribution of the work. It will be gathered that if we imagine a line drawn at any point of any bay at right angles to its length and passing through a certain type of machine, all the machines in the other bays and lying on this line will be of same type and will be performing the same operation. Over each such row of machines a separate foreman is placed, so that each foreman has one and only one class of machine under his charge. It may be remarked that certain of the operations are simpler and can be performed more quickly than others. To prevent congestion and to secure the maximum output, the quickest and easiest operations are made to set the pace, the more difficult operations being brought into line by providing more than one machine for them in each day. Thus walking down any bay in the direction in which the work travels, we may notice in places that two or more successive machines on either side are similar and are performing identical work.

Cutting Lubricant Arrangements

In this factory the machine tool lubricant used is a soap-and-water compound. The provision of this cutting fluid in a works of the size and nature of that here described is no small nor insignificant matter. The arrangement adopted is to provide central pumping stations for the fluid, with an overhead delivery pipe with branches to each machine and a trench or gulley leading into a main trench and well, wherein the used fluid is collected ready to be strained and returned by the pumps to the overhead delivery pipe. There is one such pipe on each row of columns, so that each pipe serves two rows of machines. The lubricant having done its work, drips off into the trench beneath the machine. This trench is of concrete, there being one such trench for each row of machines. At the centre of the shop, running at right angles to the trenches, is a main trench with which the others drain; for this purpose each half trench is given a fall of 5 in. towards the centre of the shop. At each end of the main trench there is a pumping station and a suds well, 5 ft. in diameter by 18 ft. deep.

Machine Tool Foundations

In ordinary practice the machines in an engineering workshop are fixed in position by means of bolts embedded in foundations of concrete. By loosening the nuts the machines may be removed, leaving the bolts projecting from the concrete foundation. It is not quite easy by this means to secure a satisfactory job. Considerable pains, for instance, have to be taken to ensure that the bolts shall when the concrete sets, register accurately with the holes in the machine base plates. At this factory, the machines are fixed in a manner which is somewhat unusual, and which, although open to certain objections in a less critical time, undoubtedly has the merit of expediting installation. The machines are simply cemented down across the concrete suds trenches, no bolts whatever being used. The sketch, Fig. 3, will make the method quite clear.

The suds trenches of two adjacent rows of machines are united throughout their lengths by a level layer of concrete. From this level layer the columns supporting the roof rise. The arrangement gives the operators plenty of room to pass behind their machines for cleaning and adjusting them, and at the same time results in the columns being situated where they are least obstructive of room. The columns in general are supported on concrete foundations, 3 ft. square and 3 ft. deep, and are held thereto by means of bolts 18 in. long. Certain of the columns are heavier than the average. For these the depth of the foundations blocks is increased to 4 ft. It will be gathered then, that the suds trenches and the foundations for the columns form a continuous mass of concrete, which was laid as far as possible without a break.

The floor of the factory, except at the suds trenches, is of wood—a factor which adds not a little to the comfort of the workers. The ground, as we have said, was first levelled with ashes. Thereafter, old railway ties were laid down at 3 ft. intervals transversely between the columns. These directly support the floor, which is of 2 in. battens running longitudinally. Further to add to the workers' comfort, the factory throughout is steam heated. For this purpose, steam pipes are carried by each row of columns at a height of about 10 ft. above the floor level. The glazing of the roof has been tinted blue by stippling on the inside with washable distemper. This keeps out the direct rays of the sun, and has a very pleasant effect.

Machine Tool Drives

The problem of how best to drive the immense number of machines in use seems to have been very satisfactorily solved. Two factors had to be kept prominently in mind. First, the driving arrangements should not materially obstruct the natural lighting of the factory. It is quite common in certain engineering workshops to find the machine shops in a state of semi-darkness because of the tangle of belts which are required to drive the machines. Secondly, the drives to the machines should be well out of the way so as to avoid accidents.

This, if belts are used, as is the case here, is a point of the greatest importance in a factory employing female labour. These two points have been well attended to, and, in addition, the method adopted does not, we believe, result in an excessive loss of power in the transmission.

Figs. 4 and 5 are sufficient to show that the natural lighting of the factory is all that could be desired. A view is got along one of the bays in operation. It will be seen that the machines in the bay are all driven from one overhead shaft, which runs down the centre of each bay. This shaft is carried from the underside of the roof trusses, which ensures as high a position as possible; it is driven by electric motors, which are supported high up in the roof. There are either two or three of these motors in each bay, as the case may be, each driving a portion of the line shafting, which serves from 12 to 20 of the machines below. At the roughing-out end of the shop, the work done by the machines is of a heavier nature than at the finishing end of the shop, so that one electric motor is powerful enough for a greater number of machines at the finishing end than at the roughing end. From the main shafting down the centre of the bay belts slope down right and left to individual countershafts attached to girders running between the columns. Each machine thus has a separate countershaft. It is situated slightly to the rear of the machine and quite 10 ft. above the operator's head.

When the shells have been completely machined, they are varnished or lacquered inside. This work is carried out in rooms situated at the outgoing ends of the bays. These rooms are each spread over the width of two bays, and are separated from the rest of the building by walls of asbestos board $\frac{1}{4}$ in. thick nailed to the inside of a framework of wood. In each varnishing room there are several gas-heated drying stoves, where the shells after varnishing are baked for two hours.

Leaving the lacquering rooms, the shells are conveyed to the bonding store, an adjunct to the main building; this is screened and locked off therefrom. The bonding store may be said to be private Government ground. Here Government officials take delivery of the shells, which are finally examined and, if found satisfactory, painted externally. The arrangements made for pointing the shells are interesting. As they come into the bonding store they are hung separately on hooks suspended from an overhead runaway. Thus supported, they can be readily examined and painted, the entire operation involving the latter being conducted by a few women, each of whom is provided with a sprayer, which, served by one pipe carrying paint and another carrying compressed air, sprays the paint on to the shells when the trigger is pulled. The shells are taken down from their hooks when they are dry, being thereafter tested over their coat of paint with a gauge, following which they are ready to be stored or dispatched.

Nose pieces at the time of this writing were being machined from sections of round steel bars sawn to length. Recently, however, it has been proposed to reduce the machining required by forging the nose pieces to approximate shape under drop hammers. The objection to this course earlier has been due to the possible difficulty of cutting into the hard skin which was formed on the surface of the pieces during the forging process. The difficulty has now been surmounted by removing the scale or skin in question by sand-blasting, before machining.

Management and Welfare

We have already indicated certain features in the working of the factory bearing on the all-important matter of the health and welfare of the girl workers. Some other facts connected with this subject may be stated by the way of conclusion. The control of the girl workers, so far as what may best be described as domestic matters are concerned, is in the hands of a principal lady supervisor. Under this lady are three sectional lady supervisors, each responsible for a section of the works. Under each sectional supervisor are two assistants. In addition to these, there are one lady canteen supervisor and three canteen assistants. Three fully trained nurses have been engaged, one at least of whom is always on duty. These nurses attend to any cases of accident or sudden illness, and keep a watchful eye on the general health and condition of the girls. Speaking of accidents, it may be remarked that up to the date of this writing, none requiring the use of a stretcher had occurred, though these are provided for. As for

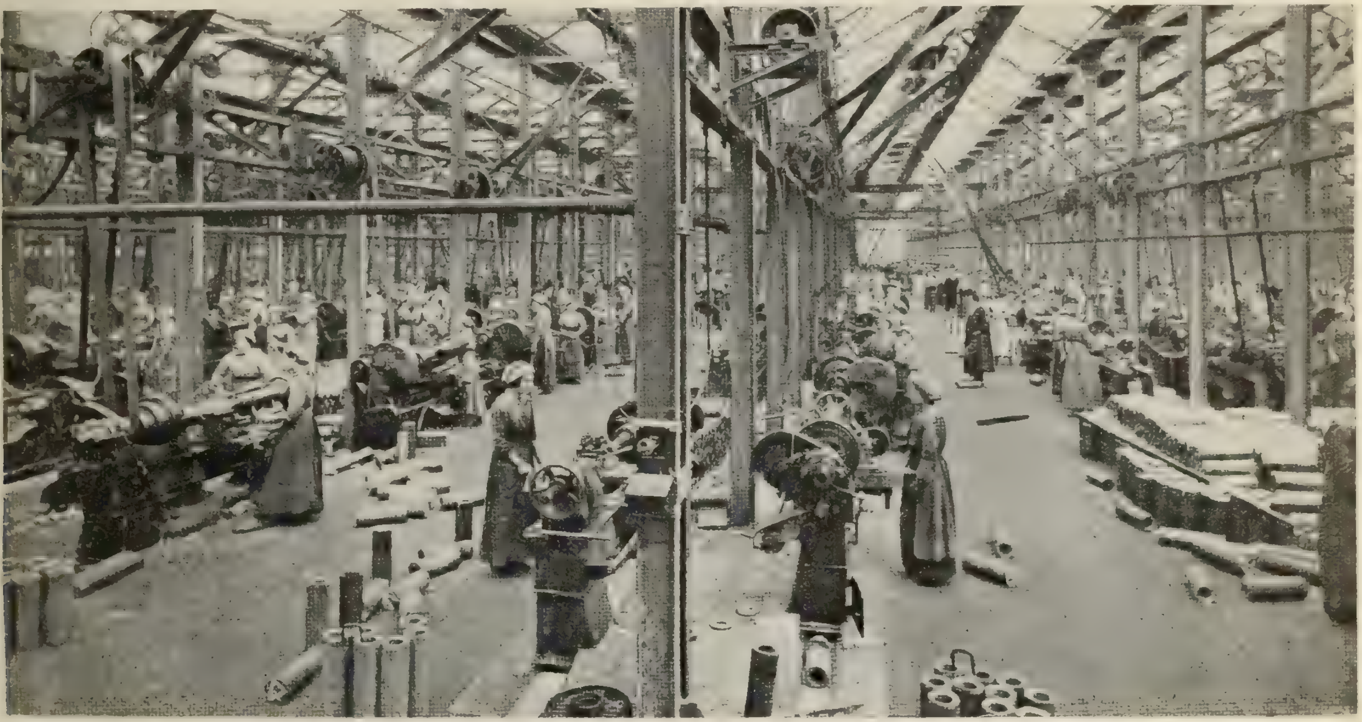

FIG. 5. LONGITUDINAL VIEW IN SECTION OF MACHINE SHOP, BRITISH NATIONAL SHELL PLANT.

minor accidents, such as cut and bruised fingers, it is found that on the whole these are more numerous than with men employees. This is explained quite satisfactorily by the existence of a rigid rule which requires every mishap, however small, to be reported and attended to at the ambulance room, whereas with male workers many a cut and so on is attended to by the workers themselves without a report being made.

Plant Hours

The hours of the factory are divided into three equal shifts, namely, from 6.30 a.m., to 2.30 p.m., from 2.30 p.m. to 10.30 p.m., and from 10.30 p.m. to 6.30 a.m. Half-way through each shift there is a break of half an hour for a meal. Particular inquiry was made as to how the efficiency of the night shift compared with that of the others. As the workers are girls, it was expected to find quite a perceptible reduction of the output during the third shift. Experience would teach us to expect it even with men. From signed statements showing typical outputs over the three shifts separately, on not a few of the operations the output during the third shift was distinctly better than that during the first and second. In a few cases it was slightly poorer. Taken on the whole, the figures shown enable us to say with perfect certainty that the efficiency of female labour in this factory does not fall off during the night.

When the works were designed and laid out arrangements were made for the employment of girls on the smaller operations only, and to the extent of about 10 per cent. of the total employees arranged for, but before the factory started work the scarcity of men was so severely felt, and the experience proved so satisfactory elsewhere, that it was decided to arrange throughout the factory for girls to operate the shell machines, and, as stated above, it is expected that the proportion when the factory is in full working order will be 95 per cent.

This alteration entailed considerable modifications to the lay-out of the factory, which had to be developed after the factory had started work. It was found necessary to build additional ambulance rooms, cloak rooms and rest-rooms for the girl workers on a larger scale than had been allowed for on the assumption that men were to be the chief workers in the factory. A large canteen has been erected, and arrangements have been made for cooking and supplying hot meals at as low a cost as practicable.

Two facts predominate as a result of a visit to this plant. One is the apparent ease and willingness with which the girl workers have taken up their new work and the efficiency with which they perform it. The work they have to do involves lifting weights up to 80 lbs. or so—about the limit for a woman—and standing for eight hours, except for the meal-time break. It might well tax the strength of many a man. Yet they all seemed cheery and happy, and went about their work with a zest which is not always manifested among male workers.

Our other impression is one more difficult to express in suitable words. It takes the form of a consciousness that behind the good work and efficiency of the girls and the factory as a whole, there is evident to those who can see it the dominating influence of a few master hands, those, namely, of the men—the engineers, in the very truest meaning of the word—who planned the construction and working of the factory and of the machines and appliances with which it is equipped.

This influence is none the less evident because it is silent, yet silence on the subject is apt to mislead the country, and certainly has misled it and our Allies. It is, in our opinion, most desirable for all, even the enemy, to learn that Great Britain is not asleep, that her engineers realise what is required of her and that they are straining every nerve to do their duty. Self-depreciation is largely founded on ignorance of one's true worth and capabilities. From what we know, not only at the factory described in the two articles, but elsewhere, we can tell all whom it may concern that self-depreciation, at least in the matter of the supply of warlike material, is unreasonable, absurd and foolish.

* * *

CASE HARDENING WITH CYANIDE

FOR many purposes a thin, hardened outer surface is required on wrought-iron or steel articles. This can be quickly secured after finishing by the use of potassium cyanide. All iron and steel, roughly speaking, will absorb carbon when, at a temperature of from 800° to 850° Cent., or in smithy terms from bright to cherry red. This is taken advantage of in surface-hardening, the metal being heated to this point, preferably in some form of muffle, even rough. At this stage the metal can be plunged into a bath of melted cyanide or rubbed with a lump of cyanide held in a pair of tongs until the metal becomes dull red, after which, reheating to the hardening temperature, and immersing immediately in cold water is done to secure the greatest hardness possible. Properly done, this should turn a file. A better plan, where the size and shape of the articles permit, is to coat a piece of leather with powdered cyanide and press the heated articles on this, repeating the heating and pressing several times, afterwards reheating and quenching. For deep case-hardening, the usual method of packing and heating must be adopted.

* * *

A STEP IN THE RIGHT DIRECTION

AN important work has begun in Indianapolis with the teaching of the English language to every alien employed in a local factory. It is the outgrowth of the national "America First" movement, having for its object the training of the foreign-born resident for citizenship.

In no country is it possible to exercise intelligently the priveleges of citizenship without having first an adequate understanding of the prevailing tongue, and of what such citizenship means. So the work of education must begin at the bottom.

There are in numerous Canadian and American factories, many aliens who have never signified their desire to become citizens. Some have only a meager knowledge of English. Our country cannot grow as it should when many of its inhabitants remain ignorant of our language, and of the national customs and habits.

Now, as never before must we awaken to our responsibilities in this matter. The new education may be slow but it means preparedness.

WAR AND ENGINEERING

IF there is any fact that the war has driven more deeply into our mind than any other, it is that engineering science, next to unquestioning patriotism, is the greatest single factor in modern warfare. This fact the engineers see clearly. They know that money and men are not enough. There must be some thinking force to turn the money into guns and to prepare a way for the soldiers. While the civilian engineer is by no means fitted to plunge into active military engineering, he is prepared to make the most of a course in training.

* * *

In a recent issue the "South African Mining Journal," Johannesburg, stated that the Rand Water Board has decided to proceed with a modified scheme for supplying the Witwatersrand with water from the Vaal River. Originally the scheme was one for impounding 20,000,000 gallons of water and providing plant for pumping 10,000,000 gallons to the Rand. It has now been decided to proceed with the erection of the barrage on the original lines, but to instal a plant capable of dealing with only 5,000,000 gallons. The cost of the scheme is estimated at $3,790,000, including an amount of $210,000 already expended for surveying, etc.

AUTOMATIC DISTRIBUTING VALVE FOR STEAM PUMPS

Designed to meet all the requirements of a successful device for controlling the distribution of steam in pump cylinders, the Attwood Patent Operating Valve is applicable to both horizontal and vertical pumps without any change. An explanation of the working is given in the following illustrations:

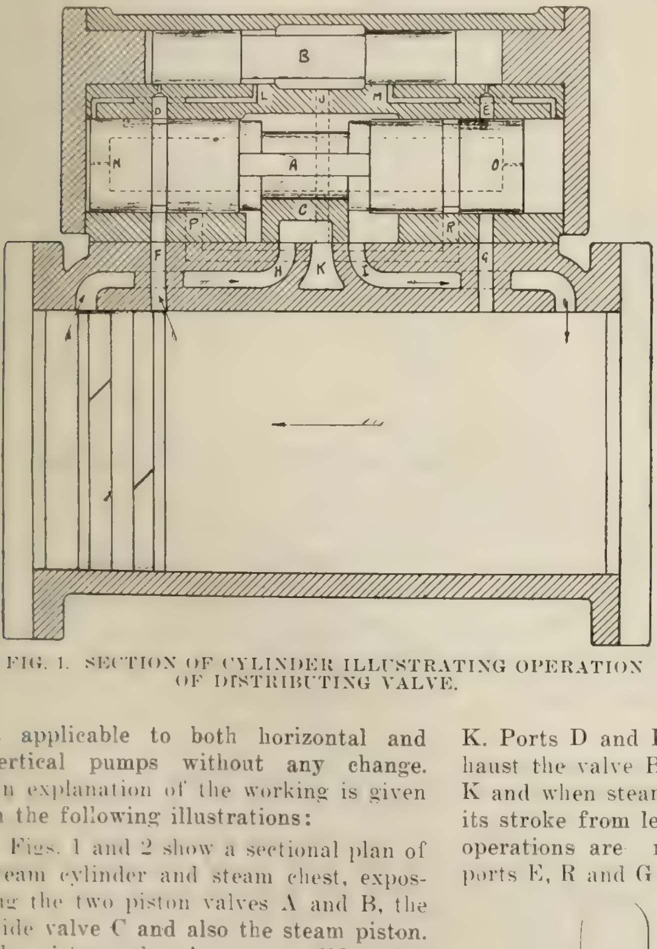

FIG. 1. SECTION OF CYLINDER ILLUSTRATING OPERATION OF DISTRIBUTING VALVE.

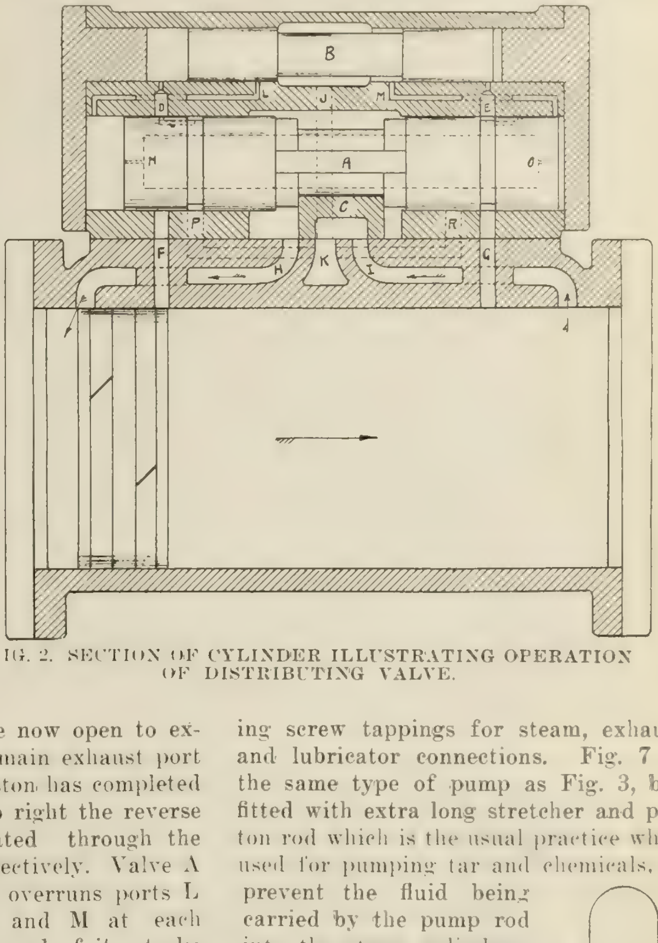

FIG. 2. SECTION OF CYLINDER ILLUSTRATING OPERATION OF DISTRIBUTING VALVE.

Figs. 1 and 2 show a sectional plan of steam cylinder and steam chest, exposing the two piston valves A and B, the slide valve C and also the steam piston. The piston valve A engages slide valve C, which opens ports H and I to live steam and to exhaust port K alternately in order to operate the steam piston.

Live steam is admitted to centre compartment of steam chest containing the piston valve A and slide valve C. When the valves are in position shown in Fig 1, steam is entering cylinder by port I, and exhausting from cylinder by port H to main exhaust port K. Piston has completed its stroke from right to left by uncovering port F, and admitting steam by ports F and D on to end of piston valve B, which is now moved to the position shown in Fig. 2. Ports N and O admit live steam from the centre compartment of chest through the inside of piston valve A to the outer ends of same.

In Fig. 2 piston valve B has uncovered port M, and steam is exhausted from the right end of valve A through ports M and J to main exhaust port K, while port L is covered to the exhaust port J and steam accumulates at left end of valve A through port H and moves valve A from left to right, opening port H to live steam and port I to main exhaust, K. Ports D and P are now open to exhaust the valve B to main exhaust port K and when steam piston has completed its stroke from left to right the reverse operations are repeated through the ports E, R and G respectively. Valve A overruns ports L and M at each end of its stroke thus preventing waste of steam.

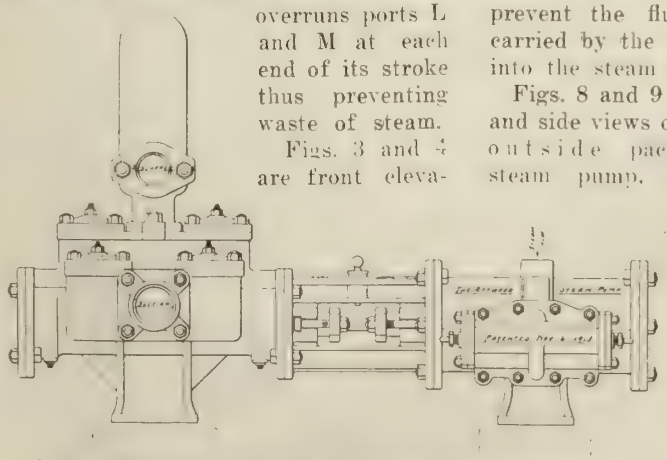

FIG. 3. ELEVATION OF INSIDE PACKED POT VALVE PUMP.

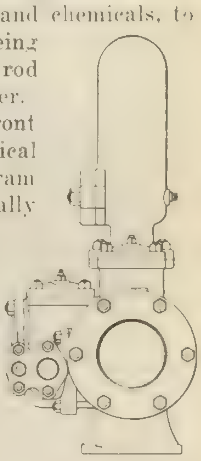

FIG. 4. END VIEW OF FIG. 3.

Figs. 3 and 4 are front elevation and end views of the Attwood patent horizontal, inside packed, pot valve pump, which is designed for medium pressure boiler feeding, tank, vacuum, and general purposes. Fig. 5 is a cross section through one end of the steam cylinder showing the main steam port entering the lower side of the cylinder bore.

Fig. 6 is a cross section through centre of steam cylinder and steam chest, showing screw tappings for steam, exhaust and lubricator connections. Fig. 7 is the same type of pump as Fig. 3, but fitted with extra long stretcher and piston rod which is the usual practice when used for pumping tar and chemicals, to prevent the fluid being carried by the pump rod into the steam cylinder.

Figs. 8 and 9 are front and side views of vertical outside packed ram steam pump, especially designed for high pressure boiler feeding and also for mine sinking purposes. Engineering readers will at once notice a distinct advance in the right direction by placing the steam chest and cylinder ports of the Attwood pump on the side of the cylinder instead of on the top as in previous designs, thus enabling the steam ports to drain the cylinder at every stroke of the piston, rendering the use of cylinder drain cocks quite unnecessary. Every operating engineer knows of the trouble caused by water accumulating in a pump cylinder when the steam ports are located on top of the cylinder necessitating the drain cocks to be left slightly open all the time to prevent water hammer. This condition becomes still more aggravated in a vacuum pump operated by a governor when used on a steam heating system owing to the slow piston speed and occasional periods of rest. Condensation will accumulate in the steam line as well as in the steam cylinder.

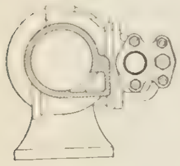

FIG. 5.

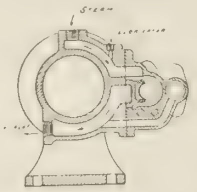

FIG. 6.

Vacuum pumps on low pressures will frequently refuse to start off the governor under such conditions until the cylinder drain cocks are opened. Again pumps for mining purposes have long and tortuous steam lines which are not insulated and frequently have cold water dripping on them from the roof. Such conditions are the worst possible and produce the maximum amount of condensation and trouble for the engineer. The cylinder and valve becomes water-logged, lubrication is washed away, rod and joint packings are ruined and cylinder heads and pistons are frequently broken because the cushion is destroyed by the presence of water in the cylinder.

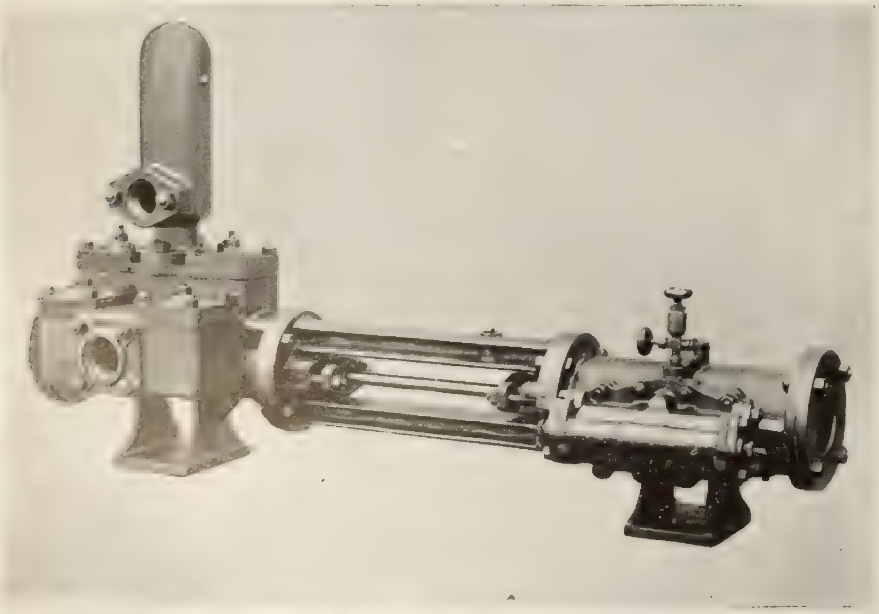

FIG. 7. HORIZONTAL, INSIDE PACKED, POT VALVE PUMP WITH EXTRA LONG STRETCHER AND PISTON ROD.

An examination of the drawings accompanying this article reveal two notable facts, viz.: 1st. The simplicity of the valve motion and its operation. 2nd. A complete automatic self-draining system accomplished by the disposition of steam chest, steam cylinder ports and pipe connections, as illustrated in Figs. 5 and 6.

It is apparent that cylinder drain cocks are superfluous because condensation through all the operations drains to the atmosphere by gravitation and the arrangements of steam ports permit the use of saturated steam without any risk to the cylinder head as already demonstrated by a series of daring experiments carried out under the worst conditions.

Figs. 8 and 9 show improved designs of a vertical outside packed ram pump which has the special feature of dispensing with one of the ram packing glands used on this type of pump, thus enabling an outside packed pump to occupy practically no more space than an inside packed pump of same length of stroke.

The saving in weight, friction, packing and space appeals to marine and stationary engineers alike, and the moving parts which are accessible without disturbing any pipe connections are a feature of convenience that will be appreciated by everyone experienced in the upkeep and repair of machinery.

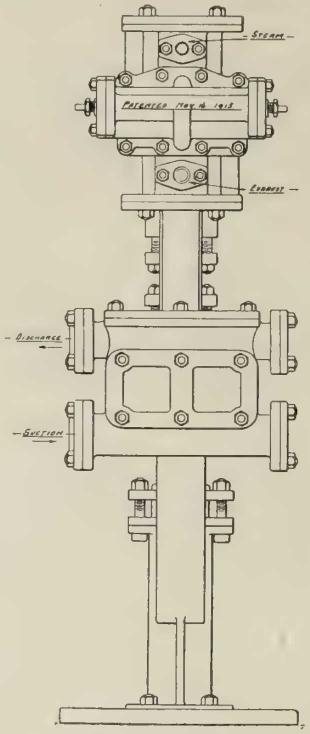

FIG. 8. FRONT ELEVATION OF OUTSIDE PACKED RAM PUMP.

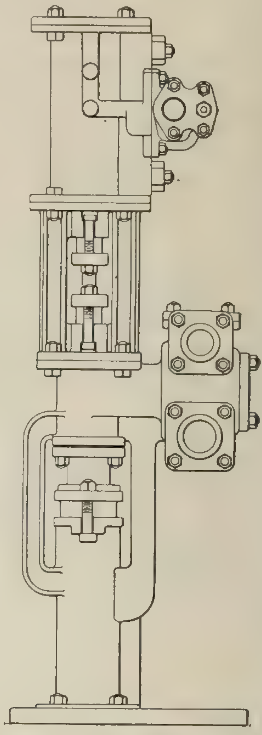

FIG. 9. SIDE VIEW OF FIG. 8.

CONSIDERATION OF ASSISTANTS

THERE are two principal ways for a manager and his assistant to work together. One kind of a manager works very hard himself and does not leave much of importance for his assistant to do. The other kind lets his assistant do all he can while he reserves his own time and thought chiefly for things the assistant cannot do—at least, cannot do so well. He puts responsibility on his assistant just as fast as the assistant shows his ability to take it.

The firt manager retards his own growth and that of his assistant. He is always over-worked and has little or no time to think of new things . He is often doing work that should have been done several days before. His assistant either chafes under the restraint, or concludes that he is incompetent, and settles into a dull mediocrity.

The second manager has time and opportunity to grow, and gives his assistant room to grow also. The assistant feels his own strength, and loves his work. He shoulders the responsibility with eagerness, and the work goes merrily on. Ask yourself, which is best.

MUNITIONS OUTPUT SHORTAGE—THE LABOR AND CONTRACT PRICE FEATURES

A STUDY of the descriptive article in another section of this issue, covering the machining department of a British National Shell plant should have the result of providing timely enlightenment to those—male and female, whose enthusiasm outpoints their intelligence in the matter of seeking to thrust on Canadian metal-working plant managements the onus of refusing to employ women munitions workers on either a lesser or greater scale, or at all. Among a number of things to be noted in this particular plant—which by the way is but a unit of a myriad so established enterprises, the fact of its bearing the qualification "National," has quite a good deal of significance for our patriotic citizens, and especially so for our equally patriotic, responsible Government.

Official Support Lacking

Catering to the spectacular has not been overlooked by our Government in this war-time, yet the erection of even a modest number of "National" munitions plants does not appear to have harmonized with the rest of the display. Has it been because the "National" would have overshadowed the individual achievement? Whatever the reason it has been wholly left to our metal-working plant administrations to work out our national salvation, and, when opportunity offered, to be well slammed as seekers after abnormal profits. It appears to be pretty well substantiated that the manufacture of brass cartridge cases is quite remunerative, yet as regards the plants so engaged, their number is a mere handful in the scope of our munitions production, and as a consequence they figure little—if included at all as contributories to the present munitions output shortage.

The munitions product in its main and detail part into which steel enters is what our manufacturers and the Imperial Munitions Board are exercised over meantime, although their views may be said to be widely divergent as to the cause or causes from which the falling off in production arises. It will be clearly evident from the British National Shell Plant description and illustrations that the general conditions for female operators are as nearly as possible ideal, and that therefore their substitution for men already enlisted and their being procured to take the place of still employed, but eligible men, become comparatively easy of accomplishment. To anyone familiar with our metal-working plants generally, the comparison between them and the British National Establishments is odious, for, right from the entrance gates in the case of the former, an atmosphere for "men only" makes its presence felt; nor do we expect other, for in their establishment and institution they were designed and laid out so.

Theoretical Displaces the Practical

Isn't it more or less a waste of time for the Munitions Board to keep "harping away on this female employment string," in view of what has been said, and taking account of the disabilities under which not only the women would labor, but all concerned in the plant management. Our manufacturers equipped their plants to handle both quality and quantity output of munitions, and received in the beginning, we believe, prices which enabled them to do so more or less profitably. A new situation has arisen, but in many respects similar to that which marked the institution of shell-making within our borders. Male labor is scarce through enlistments for overseas service, the output of munitions has materially decreased, our Government still continues to look on, and the Imperial Munitions Board invites manufacturers to save the situation by employing female labor, while apparently ignorant of plant conditions to make the latter possible. The Board cannot, we understand, establish "National" factories, and both it and our Government appear equally helpless in furnishing direct assistance in the matter of extending or rearranging plants whose managements are willing to employ female labor.

Why we ask should Canadian women be asked to take employment under conditions so much less inviting than their British sisters. Grievous fault was found with the Shell Committee because of its personnel being largely composed of men whose intimacy with engineering workshops was a very essential part of their every-day life. The readjustment has not, however, improved that feature. The situation is, we admit, a delicate one to adjust for, as National factories are remote possibilities, and grants to individual firms are much in the same category, there remains but an increased product price to enable the manufacture to make the necessary extensions to his plant to accommodate female labor. Just here, of course, a difficulty is still in evidence, for all need not and certainly all would not perhaps recognize female labor to be available, yet all would very probably call for the higher prices ruling on each particular munition detail.

Manufacturing Enthusiasm Chilled

In view of the foregoing we reiterate that the situation is a delicate one, but not however outside the pale of adjustment. In spite of the male labor shortage which is admittedly of considerable proportions, the manufacturers' enthusiasm as we stated a week ago has been chilled by the keenness of prices ruling, and while we are not prepared to say that more margin would eliminate the munitions output shortage, we think it would go quite a long way towards it. We are in any case quite certain that the present indifference to the employment of female labor would be less marked. The tendency to place contracts at the lowest possible prices, while praiseworthy, can be carried to extremes, and it would appear that with shell and shell part forgings of steel, brass parts, shell machining, and shell boxes, all more or less involved, prices ruling are a trifle keen. Experience proves that the speediest production is secured when manufacturers and operators have on the one hand the hope of profit and on the other the certainty of a fair rate of wages. It seems to us that it is possible to prevent the British people from being robbed without alienating Canadian manufacturers from munition contracts, as appears to be the meantime situation.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Aug. 19.—Among the more interesting features of the week are the renewed activity in pig iron and the continued buying of shell steel by the belligerent powers. The latter has assumed a more desirable aspect in the eyes of some producers by reason of a substitution clause whereby the original form in which the material was ordered may be changed at the option of the purchaser, the balance being taken in sections such as structural shapes, plates, bars and other non-war purpose forms. Satisfactory crop reports continue to be received from the various grain districts with the usual stimulating result on business conditions generally. Business in machine tools and allied products shows signs of further activity in the future but deliveries which are the chief basis of present business have suffered somewhat as a result of the renewed activity in export business from the States.

Pig Iron

Prices continue firm as a result of increased enquiry for both home and foreign consumption. Any prospects of future advances are the subject of close scrutiny by large consumers, although for the present a small amount of price shading has been done on early deliveries. Pittsburgh prices remain steady at $21.95 for Bessemer, $18.95 for basic. and $19.45 for No. 2 foundry.

Steel

The recent advance in bars to 2.60c Pittsburgh following the placing of extensive contracts for large shells has given considerable impetus to buying both by manufacturers and merchants. Efforts are now being made to place contracts for the remainder of this year and the first half of next but producers are not over anxious to accept even at present prices. Pressure from foreign buyers of shell steel has finally forced producers to get down to business in spite of their desire to accommodate domestic consumers, however dilatory these may have been. Shell steel is now held at 3.75c to 4c per pound Pittsburgh. Structural shapes are quoted 2.50c to 2.60c, soft steel bars 2.50c to 2.60c, hoops 2.75c to 3.00c, bar iron 2.65c to 2.75c, all Pittsburgh. Semi-finished materials are quoted as follows f.o.b. Pittsburgh. Forging billets, $65 to $70; Bessemer billets, $45 to $46; open hearth billets, ditto; Bessemer and open hearth sheet bars being also quoted at this price. The demand for plates and sheets continues strong. Consumption of plates on the Pacific coast continues at a high rate while the efforts of foreign builders to secure supplies on this continent has contributed to the present high export prices obtainable. Shipyards on the eastern seaboard are already negotiating for material, while railroad companies are known to have absorbed large tonnages on rolling stock maintenance.

Tank plates are quoted 3.50c to 4.00c Pittsburgh, a few widths being quoted at 3.00c to 3.25c, with 3.50c for immediate delivery. Up to the present no figure has been mentioned as to the price of sheets for fourth quarter of this year, although some consumers are even now endeavoring to contract for next year shipments. The demand for black, blue annealed and galvanized sheets remains unchanged. Pittsburgh quotes blue annealed, Nos. 9 and 10 (base), 3.00c to 3.25c; Nos. 3 to 8, 2.95c to 3.25c; Nos. 15 and 16, 3.20c to 3.45c. Galvanized sheets, No. 28 (base), 4.25c to 4.50c; Nos. 10 and 11, 3.25c to 3.50c; Nos. 22 and 24, 3.80c to 4.05c. Cold-rolled box annealed, Nos. 9 to 10 (base), 3.00c to 3.25c; Nos. 15 and 16, 3.20c to 3.45c. Tin plate, $6 per 100 lb. The demand for shapes for home consumption is comparatively quiet owing to continued high prices, 2.60c being asked for some shapes at Pittsburgh. Export demand still retains fair proportions.

Metals

Spelter has been an interesting member of the metal markets this week, export and other business having been placed covering business to the end of the year. Much interest attached to the announcement that Great Britain had reached an agreement with Australia whereby the former contracts to purchase 100,000 tons of zinc concentrates and 45,000 tons of spelter annually during the war and for ten years afterward. Something of this nature has been expected for some time in view of the announcement by Australia some time ago that the industry would never be again tainted with German influence. Copper, tin, and lead are quiet and firm, with a slight upward tendency during the week. Antimony has registered a 50 per cent. increase in a few days from the recent low price, largely as a result of the stoppage of sales by importers.

Copper.—Large sales are reported on an active market. No definite information has been obtained regarding the progress of large foreign orders under negotiation, and until this is disclosed the market will remain more or less exitable. London quotes spot standard at £111, futures at £108/10, and electrolytic at £127. New York reports that during the last few weeks home consumers have purchased up to possibly 150,000,000 pounds, despite the fact that large producers were considered to have sold up to the end of the year. Prime lake is quoted at $31, electrolytic $31, and casting $30.

Tin.—The getting of permits for Straits tin continues to be difficult with a corresponding strength showing in Banca tin. Near futures at reasonable prices are obtained with difficulty. Spot tin is steady at $28.25 to $32.75 New York, and £169/5 spot, £170/5 futures, London. Local quotation 43c per lb.

Spelter.—General conditions continue to justify the recent strength shown by spelter. The galvanized sheet trade holds promise of more activity. More than half of Australia's annual output is booked for a term of years, and several large producers report contracts covering from 50 per cent. to 75 per cent. of their output for the balance of the year. Prices are firm at 14c per lb.

Lead.—Increasing strength has been shown during the week. Recent good sales by independent producers have prepared the market for an advance, which was promptly followed by the Trust. Local price 8½c per lb.

Antimony.—Great activity in antimony was a feature of the week, and the recent low level of $10.50 has disappeared in the rapid advance. All of the metal offered is obtained from distant sources, which fact, along the increased demand for ammunition, points to higher prices for some time. The fact that only a few months ago antimony was almost three times its present price shows that a substantial jump is not impossible from the present price of 17c per pound.

Aluminum.—No change is noted in aluminum, present prices remaining firm at $58 to $60 for No. 1 Virgin, $56 to $58 for pure re-melt, and $45 to $47 for No. 12 alloy re-melt. Local price 68c.

Machine Tools and Supplies

Conditions are practically unchanged so far as demand is concerned. Considerable business is promising, but majority of inquiries are not productive of immediate results. Deliveries have suffered somewhat, due to the recent recurrence of activity in certain branches in the States, but with the greatly increased production there, this condition is more or less temporary. Small tools and supplies continue in good demand. No great stock of supplies has been laid up by consumers, and orders are for immediate requirements only and correspondingly urgent.

Scrap

Dealers report very little activity, although prices are fairly well maintained. The renewed strength of pig iron is expected to improve matters, and conditions during the fall should be more satisfactory.

Toronto, Ont., Aug. 22.—The shortage of raw materials particularly, semi-finished steel, will doubtless be the most important result of the heavy new demand for steel. The shortage will be reflected in prices and deliveries of practically all kinds of machinery both small and large. Until recently it was thought that the crest of the upward movement had been reached, but the new developments have changed the aspect of the situation and previous calculations have been upset. In addition, the scarcity of skilled labor will help to further complicate matters which have already reached an acute stage. The combined effect of these two causes will mean a further reduction in output at a time when maximum production is so much desired and in the case of munitions and war supplies, imperative.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Steel

Although there have been no price changes in this market except in wire nails since the recent new buying movement started in the States, it is very likely that an advance in some steel products may be made in October for the fourth quarter, if not before then. Apart from the demand for steel for munitions, business is above the average for this month and is much better than for the corresponding period last year. Not only has domestic business improved but the steel companies continue to do a large export trade. In addition to its large output of shell steel, the Steel Company of Canada is making arrangements to take care of the increased demand for steel for other purposes. All signs point to a continuance of the present extraordinary activity in the steel trade for a considerable part of 1917. Prices of all steel products continue very firm, the plate situation being particularly strong owing to the heavy demand in the United States for ship and other plates, except car material. The boiler tube situation is unchanged , there being a continued heavy demand in the primary market for merchant and locomotive tubes. Prices of wrought iron pipe are firm and unchanged, particularly black pipe although galvanized material has recovered from its recent weakness.

The situation in the sheet market continues firm and unchanged. The demand for black and blue annealed sheets remains steady although prices are somewhat irregular. An advance of $2.00 per ton on sheet bars has stiffened the market for black sheets and may result in higher prices, as sheet bars are now considerably higher than at the time when black sheets were last advanced. Prices of galvanized sheets are firmer but the demand is comparatively light at the present time and the output of the mills is much below normal.

The greatest activity again characterizes the steel trade in the United States since the new buying movement started. Domestic consumers who have been for some time waiting for price recessions will now have to pay higher instead of lower prices for their steel. As a result of the new demand a more pronounced scarcity of semi-finished steel has developed which will affect the situation to a greater degree than higher prices. Prices of Bessemer billets and open-hearth sheet bars have advanced $2.00 a ton and are now quoted at $45.00 and $47.00 per ton respectively f.o.b. Pittsburg. Steel bars are now quoted at 2.60c; plates 3.50c and shapes 2.50c f.o.b. Pittsburg.

Pig Iron

The pig iron market is marking time and the situation is unchanged. The demand for steel-making grades of pig iron is as insistent as ever, but foundry iron is quiet. Quotations are unchanged.

Machine Tools

The situation in the machine tool market is unchanged, business being almost entirely with munitions plants. A steady demand continues for large swing lathes, while tool maker's equipment is in fair demand. Deliveries are showing some improvement but no price revisions have been made recently although advances are looked for on some lines of machine tools.

Supplies

The demand for machine shop supplies continues brisk with prices very firm, particularly for iron, steel and brass goods. The shortage of raw materials is adversely affecting the situation, causing a scarcity of some supplies. White lead has declined 50c per 100 lbs., and is now quoted at $13.45 per 100 lbs. in ton lots.

Metals

The metal markets have undergone a decided improvement during the week with an upward trend in prices. The stronger tone is a result of heavier demand which is particularly evident in copper and spelter. Business locally has improved and is good considering the time of the year.

Copper.—The large buying of copper for the Allies and enquiries for additional large amounts of metal has resulted in a strong market and higher prices. It has also had the effect of forcing domestic consumers into the market and an important selling movement is now in progress. Sales of copper for delivery during practically the next twelve months have been made and indications point to a high level of prices for that period. Copper has advanced ½ cent locally and is now quoted at 29½ cents per pound .

Tin.—An improved undertone in the tin market due to heavier demand has had the effect of advancing prices. Tin is now quoted at 44c per pound.

Spelter.—The recent declines in spelter would appear to have stimulated business as the demand has considerably improved during the week. Galvanizers are buying more spelter and brass mills are taking more metal. Local quotations are higher at 14c per pound.

Lead.—The position of lead is strong and the price has advanced, the Trust now quoting 6.25c, New York with independents at the same level. The market at present is rather slow but a much improved demand is anticipated. Lead is now quoted at 8½c per pound.

Antimony.—The demand is active with the market higher and excited. The price has advanced and indications point to still higher prices. Antimony has advanced 1c and is quoted locally at 17c per pound.

Aluminum.—The market is quiet but firm with quotations unchanged at 68c per pound.

Solder.—Quotations are firmer but unchanged. Guaranteed is quoted at 27½c and strictly at 25½c per pound.

Trade Gossip

Quebec Bridge.—It is expected that between September 14 and 16 the great centre span of the Quebec Bridge will be floated into position. This will pave the way for the opening of the structure early next year.

Paper Industry Develops.—It has been stated on good authority that there are in course of erection in the Dominion of Canada paper mills and increased machinery sufficient to make at least 750 tons a day of extra product.

Flaws In Steel Rails.—President A. H. Smith, of the New York Central, has announced that Dr. Plimmon H. Dudley, head of the railroad staff of scientists, has discovered the cause and an absolute remedy for hidden flaws in steel rails

The Jenckes Machine Co., of Sherbrooke, Que., have been awarded contracts for steel and cast iron columns by the Canadian Cotton Mills for a factory extension, and by the Sherbrooke Railway & Power Co. for a transformer station.

The Tivani Steel Co., Belleville, Ont., which has been experimenting for some time on an electric smelting process for the direct reduction of refractory ores, is now about to engage on a commercial scale in the manufacture of high-speed molybdenum steel. A three-phase electric furnace is used.

The Standard Ideal Co. plant, Port Hope, Ont., has been sold to L. M. Wood, of Toronto, president of the Standard Chemical Co. of Toronto, and associates, among whom are W. D. Ross, financier. The new company will take possession at once, and will carry on the present line of business. It is understood that the name of the concern will be changed to the Port Hope Sanitary Mfg. Co.

French Steel Output.—Steel production in France during the second year of the war was double that of the first year, it was shown by statistics submitted at a general meeting of the French Steel Association recently. Eighty per cent. of the pig iron and 70 per cent. of the steel prior to the war was produced in the part of France now invaded.

The Manitoba Steel Foundries, McArthur Building, Winnipeg, states that its new foundry is nearing completion, and that one furnace will probably be in operation September 1. The company will make electric steel, both in the form of castings and ingots for rolling, and when in full operation will have an annual capacity of 8,000 to 10,000 tons. A. M. Tirbutt is secretary and treasurer.

Copper Output Up to 50 Per Cent.—Twenty leading copper companies operating in the United States, Canada and South America produced approximately 895,000,000 pounds of copper in the first half of 1916, an increase of 299,000,000 pounds, or 50 per cent., over the corresponding period of last year. Of these, the Anaconda made the largest individual increase—52,300,000 pounds more than a year ago.

Thanks Canadian Firm.—The official Press Bureau, London, England, recently gave out this statement: The Canadian Cartridge Co., at Hamilton, Ont., having completed a large contract for cartridge cases, handed the Imperial Munitions Board of Canada $758.248, this sum being the difference between the contract price and the cost of the materials and the manufacture. Minister of Munitions Montague thanked the company for its patriotism.

Sulphuric Acid Plant.—The new sulphuric acid plant of the Consolidated Mining & Smelting Co., at Trail, B.C., is now in operation, being the only plant of its kind in B.C. The acid is recovered from the sulphur fumes from the furnaces, previously allowed to go to waste. The output is about ten tons daily, of which five tons is required for use in the company's own works, the balance being readily sold on the market, which at the present time is poorly supplied, prices having risen considerably since the war.

Windsor, Ont.—Charles A. Bradley, manager of the Windsor branch of Remington Arms Co., is authority for the statement that negotiations are in progress for the sale of the company's Windsor property to a syndicate composed of New York capitalists. Mr. Bradley said that a change in the policy made by the Remington parent company intended to centralize the business at Bridgeport, Conn., is the reason why the Windsor plant is on the market. Since the Remington firm located here four years ago more than $40,000 has been spent in additions to the factory. Over 150 men and girls are employed.

Australian Spelter Contracts.—It is reported from London that an agreement has been reached between Great Britain and Australia, under which Great Britain contracts to purchase 100,000 tons of zinc concentrates, and 45,000 tons of spelter annually from Australia during the period of war, and for ten years afterwards. The effect of the agreement will be to ensure the transfer of the smelting industry from Germany to British hands. The amount exceeds $25,000,000, covering more than half of Australia's annual report output. The remainder of the output is expected to be taken over by France and Belgium.

Safety of Explosive Plants.—It is announced from Ottawa that an Order-in-Council, under the War Measures Act, 1914, in order to make greater provision for safety in explosives factories, provides that every person who takes or attempts to take or assists in taking any matches into any explosives factory or into any building, enclosure or place wherein the manufacture of explosives is being carried on, or has matches in his possession while in any such factory, building, enclosure or place, is liable to a fine not exceeding $100 or to imprisonment for any term not exceeding six months, or to both fine and imprisonment.

Tungsten in B.C.—Considerable interest attaches to a discovery of tungsten ore on the Mud Creek claims of Wm. Thompson and Barney Halloran and while the amount of this valuable mineral is not yet sufficient to warrant working the property for the tungsten values alone, the fact that this mineral exists has added a new incentive to prospecting and mine development in this district. Advices from the Mines Department at Ottawa are to the effect that tungsten ore carrying 60 to 65 per cent. of the mineral is worth $4500 per ton, and that the ore may be marketed through the Canadian Munitions Resources Commission.

Australian Parliament Bldgs.—Canadian architects are to be given the opportunity of competing for the furnishing of plans for the construction of the new Australian Parliament buildings. Their construction was planned before the war, but was allowed to lapse at the outbreak of hostilities. The following cablegram, however, has been received by the Prime Minister from the Acting Premier of Australia: "With reference to my telegram of September 25, 1914, in the matter of both Houses of Parliament, the architectural competition for the Federal Capitol, issued 1914, has been resumed. Designs are receivable to January 31, 1917. Would appreciate publication."

Tinplate Industry to be Revolutionized.—It is reported from Cardiff, Wales that the tinplate industry is about to undergo a revolutionizing process owing to the introduction of a new method of tinning and preparing plates for tinning, according to an announcement made by the Mellingriffith Tinplate Works in South Wales. The process now said to be in successful operation dispenses with the necessity of white pickling, and the white annealed plates, after being separated, are, without handling, taken up by machinery and picked, washed, turned, cleaned and piled. It is asserted that the new method increases the production of tinplates in the proportion of more than two to one as compared with the ordinary process.

Government Sells C.G.S. Montmagny.—The Canadian Government steamer Montmagny, which has been beneath the waters of the St. Lawrence, near the Island of Orleans, for almost a year, has been sold by public tender to the St. Charles Navigation Co., of Quebec, for $25,000. The vessel originally cost over $100,000. A contract was some time ago given to the Levis Wrecking Co. to raise the Montmagny, but they were unsuccessful.

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Sarnia, Ont.—The Sarnia Gas Co. is making considerable extensions to its gas mains.

Chatham, Ont.—The directors of the Gray-Dort Motor Co. have decided to extend their plant here.

Toronto, Ont.—The Bawden Machine Co., will build a two storey addition to their factory at a cost of $2,000.

Niagara Falls, Ont.—The Pollard Mfg., Co., will shortly begin the construction of a foundry to cost about $40,000.

Toronto, Ont.—John T. Hepburn, Ltd., 18 Van Horne street, will erect a one-storey frame galvanized iron addition to machine shop at a cost of $3,000.

Niagara Falls, Ont.—Plans have been prepared for the erection of a $200,000 addition to the Lincoln Paper Mills at Merritton. The addition will consist of a sulphite plant.

Hamilton, Ont.——The Brown-Boggs Co. has awarded a contract for the rebuilding of their plant to H. G. Christman & Co., of Hamilton. The cost will be about $15,000.

Joliette, Que.—The Joliette Steel Co., whose head office is in Montreal, is in the market for a new or second-hand three to five-ton suspension scale for weighing steel castings.

Port Arthur, Ont.—The Canadian Northern Railway will shortly proceed with the construction of a machine shop here. The general contract has been let to J. Brown of Winnipeg.

Toronto, Ont.—The Toronto Suburban Electric Railway are installing a new generator supplied by the Canadian Westinghouse Co., of Hamilton, in the power house on the Weston Road.

Port Colborne, Ont.—It is understood that the International Nickel Co. will establish a nickel refining plant here. Options have been secured on a site and other preliminary work has been started.

Cornwall, Ont.—Additional machinery, will be installed by the Toronto Paper Mfg. Co., which will bring the capacity of the plant up to 30 tons per day. R. S. Waldie is president and W. Wallace is manager.

Toronto, Ont.—The Canadian Hanson and Van Winkle Co., will build an extension to their foundry to cost $7,000.

Ottawa, Ont.—The construction of a civic workshop is contemplated by the City Council. A. F. Macallum is city engineer.

Goderich, Ont.—The Doty Foundry, which has been closed for some time past, will in the near future be reopened, and everything will again be in full swing. An arrangement has been reached by W. J. Thorold and the local Town Council, and the former will continue the operation of the plant.

Kingston, Ont.—Lewis F. Houpt, of Buffalo, has purchased the Thomson paper mills at Newburgh, and has organized a company. He is having the building repaired and machinery installed. The concern will manufacture all high-grade bond papers. Mr. Houpt is now president of the George Irish Paper Co., Buffalo, and the Monarch Paper Co., Toronto.

Toronto, Ont.—The William Davies Co. have had plans prepared for the erection of three buildings of flat slab concrete construction on Front Street east. The company will erect an abattoir and tank house, five and three storeys respectively, to cost $60,000; a cold storage building, six storeys, to cost $100,000, and stock pens, seven storeys, to cost $40,000. The total expenditure on the buildings will be $200,000.

Toronto, Ont.—The British-Canadian Refining Co. have been granted a lease by the Ontario Government for the development of power on the Wahnapitae River, to be used in connection with their proposed smelting works near Sudbury. The Hon. G. Howard Ferguson, who made the announcement recently, declared that four or five million dollars

Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department is able to present the following list of the moreimportant British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

BRAZIL
Bahia, British Consul.
Rio de Janeiro, British Consul General.

CHILE
Valparaiso, British Consul General.

COLOMBIA
Bagota, British Consul General.

ECUADOR
Quito, British Consul General.

EGYPT
Alexandria, British Consul General.

FRANCE
Havre, British Consul General.
Marseilles, British Consul General.

INDIA
Calcutta, Director General of Commercial Intelligence.

ITALY
Genoa, British Consul General.
Milan, British Consul.

MEXICO
Mexico, British Consul General.

NETHERLANDS
Amsterdam, British Consul.

PANAMA
Colon, British Consul.
Panama, British Vice-Consul.

PERU
Lima, British Vice-Consul.

PORTUGAL
Lisbon, British Consul.

RUSSIA
Moscow, British Consul General.
Petrograd, British Consul.
Vladivostock, British Consul.
Odessa, British Consul General.

SPAIN
Barcelona, British Consul General.
Madrid, British Consul.

SWEDEN
Stockholm, British Consul.

SWITZERLAND
Geneva, British Consul.

URUGUAY
Monte Video, British Vice-Consul.

VENEZUELA
Caracas, British Vice-Consul.

Single or Double Friction Back Geared

LeBlond 14-in. Q.C. Engine Lathe as the keystone of your tool-room equipment will at once stamp that department as "efficient." It has a 4-step cone for a 2-in. belt and graduates from 4¾-in. to 10¾-in. dia., compound rest, follow rest, steady rest, swings over shears 15¼-in., swings over carriage 9½-in., distance between centres 3-ft., weight 1725 lbs. By these few specifications and a study of the upper illustration you will see that for quality, strength, rigidity and efficiency this machine would fit exactly into your requirements.

Send for full particulars and specifications.

The LeBlond 24-in. Standard Engine Lathe stands pre-eminent among the many general purpose lathes manufactured, in quality, workmanship and general design. A glance at the illustration will at once impress this on you. It swings over shears 24½-in., swings over carriage 16-in., distance between centres 5-ft., 3-step cone 4-in. x 10-in., 12¼-in.—14½-in. dia., hole in sp. 1½-in., comp., steady and follow rests, weight 5700 lbs. It's a thoroughbred, a mere glance at the illustration will tell you that. But looks are not everything, if you will write us we will give you such specifications and particulars that will convince you of its undoubted leadership quality.

THE A. R. WILLIAMS MACHINERY COMPANY, LIMITED
TORONTO CANADA

will be invested in the property, but he is not ready yet to announce the terms of the lease.

Dundas, Ont.—The John Bertram & Sons Co. is calling tenders for the erection of a pattern shop.

Montreal, Que.—William Hood & Son, 10 Richmond Square, are in the market for a 10 to 15-h.p. electric motor, a heavy Bliss trimming or punching press, a power hack saw, and a 2,000-pound drop forge hammer.

Municipal

Nokomis, Sask.—It is proposed to install an electric light and power plant here.

Almonte, Ont.—The Town Council will build a Hydro-Electric plant to cost $18,000.

Halifax, N.S.—The City Council contemplate the construction of an abattoir at an approximate cost of $25,000.

London, Ont.—An extension is being made to the sewage disposal plant at an estimate cost of $40,000, The engineers are Chipman & Power, Mail Building, Toronto.

Richmond Hill, Ont.—The Village Council contemplate installing a waterworks system at a cost estimated at $30,000. James, Loudon and Hertzberg of Toronto are the engineers.

Montreal, Que.—City engineer Mercier has recommended the purchase of ten auto-flushers for the road department. These machines cost about $9,000 each.

Dunnville, Ont.—The Town Council will submit a by-law to the ratepayers for authority to borrow $53,000 for the purpose of installing Hydro-electric light and power, and to buy out the plant of the existing light company.

Lethbridge, Alta. — The following tenders have been submitted for the proposed filtration plant; New York Continental Jewell Filtration Co., of New York, $92,000; Roberts Filter Manufacturing Co., Darby, Pa., $95,000: Western Canada Foundry & Supply Co., $111,857.

North Bay, Ont.—A by-law will be submitted to the citizens in the course of a few weeks to guarantee the bonds of the Queen Hat Mfg. Co. of Toronto, and give a free site. The company will locate at North Bay if the by-law passes. The town secures a first mortgage on machinery.

Toronto, Ont.—The railway viaduct on the Esplanade may be delayed until after the war on account of the financial situation, but the Union Station will be completed. The city is financially interested in the construction of the viaduct, and it, as well as the railways, will find it difficult to finance large undertakings for some time.

General Industrial

Hamilton, Ont.—The Mercury Mills, Ltd., are building a factory here.

Ottawa, Ont.—The National Mfg., will build an extension to their factory to cost about $4,000.

Toronto, Ont.—The Willard Co., contemplate building an extension to their chocolate factory.

Burford, Ont.—The Canadian Milk Products Co., Toronto, propose erecting a factory here to cost about $100,000.

Toronto, Ont.—The William Wrigley Co., will build a large addition to their chewing gum factory on Carlow Ave.

Toronto, Ont.—Adams Brothers' Harness Mfg. Co. will erect a factory on King Street West. Estimated cost, $75,000.

Pembroke, Ont.—Damage to the extent of $10,000 was done by fire in the factory of the Pembroke Woollen Mills Co. on August 15.

London, Ont.—Plans are being prepared for an addition to a factory for J. R. Shuttleworth, hat manufacturers, Estimated cost, $10,000.

London, Ont.—plans are being prepared for an addition to the premises of the Canada Cereal Mills Co. Estimated cost, $10,000. Manager, J. A. Barnard.

Sarnia, Ont.—William P. Fitzsimons, Commissioner of Industries for the Grand Trunk, has notified A. G. Laschinger, at Point Edward, that for the present no action will be taken on the part of the dye industry to locate in Western Ontario. Negotiations, however, will be renewed at a later date, when it is hoped to make final plans for the locating of the plant at this point.

Electrical

Renfrew, Ont.—A Hydro-Electric by-law will be submitted to the ratepayers on September 2.

Dutton, Ont.—A proposal is under way for the extension of the hydro line from Dutton to Wallacetown.

Dunnville, Ont.—The Dunnville Electric Light Co. have offered to sell out their plant to the Hydro for $30,000.

Contracts Awarded

St. John, N.B.—Fire on August 11 damaged the Consumers' Sack Co.'s factory to the extent of $7,000, which is covered by insurance.

Brockville, Ont.—T. J. Davidson has received the contract for the erection of a large addition to the premises of the Canadian Briscoe Motor Car Co.

Oshawa, Ont.—J. D. Young & Son, Toronto, has received the general contract for three buildings for the Chevrolet Motor Co. of Canada, at Oshawa, Ont.

Walkerville, Ont. — The Canadian Bridge Co. has been awarded the contract for the steel girder bridge over the Nelson River at Kettle Rapids, Man., for the Hudson Bay Railway, at a cost of $325,000.

Toronto, Ont.—The Board of Control has granted contracts for seven motor fire appliances, valued at $46,103. Hugh Cameron & Co. got the contract for the tractor at $5900 and also the contract for the ladder and truck at $8500. The contract for the combination salvage and chemical wagon was awarded to the Dominion Automobile Co. at $4750. The Cameron concern also got the business for one commercial truck at $4200 and a portion of the chemical wagon order.

Personal

Sir George Foster, Minister of Trade and Commerce, has arrived at Montreal, having returned from England on the steamship Missanabie.

C. W. Knighton, general manager of the Canadian Hart Accumulator Co., of St. Johns, P.Q., has opened an office at 701 Merchants Bank Building, Winnipeg.

A. C. Towne has resigned his position with the Canadian Johns-Manville Co., Montreal, to take charge of the engineering department of the Electrical Equipment Co., Montreal .

Tenders

Toronto, Ont.—Tenders will be received up to August 29, for the supply and delivery of 36-inch cast iron special castings. Specifications may be obtained at the Works Department, Room 12, City Hall.

Toronto, Ont.—Tenders for extension to Duncan Street sub-station and addressed to Chairman, Toronto Electric Commissioners, will be received until August 30. Plans, specifications and form of tender may be obtained at the

engineering offices, corner Duncan and Nelson Streets.

Tweed, Ont.—Tenders will be received by the secretary-treasurer, High School Board, up to August 30, in whole or part, for the erection and completion of a high school building. Plans and specifications can be seen and all particulars procured at the architects' or secretary's offices. Ellis & Ellis, architects, Manning Chambers, Toronto; C. W. Huyck, secretary-treasurer, High School Board, Tweed

Marine

C. S. L. New Freighter.—Announcement is made in Detroit, Mich., that a new six hundred foot steamer being brought out for the Canada Steamship Lines, at the Superior yard of the American Shipbuilding Co., will be named after Sir Trevor Dawson, managing director of Vicker's, London. The boat is expected to go into commission some time next month.

Vancouver Harbor Dues.—Vessels using Vancouver harbor are to pay a tax of three cents a registered ton on and after August 1, according to notice from Ottawa. The harbor commissioners had this clause in their original by-laws together with other tariffs and license fees. Owing to the strong opposition engendered the tax was suspended during the war, but now the commissioners have succeeded in getting an Order-in-Council through for the imposition of the three cents tonnage tax. However, all the other tariffs and licenses are cancelled and the three cents tax is the only one. Ships will not be required to pay on more than five entries in a year. Shipping men do not regard the tax as excessive.

S. S. Saronic Total Loss.—Manager Gildersleeve, of the Northern Navigatiin Co., received that the wooden steamer Saronic had burned to the water's edge on the shore of Cockburn Island, Georgian Bay, where she was beached by her skipper, Capt. J. D. Montgomery, when she broke into flames amidships on Lake Huron early Sunday Morning. The crew of 21 men landed on this bleak shore in lifeboats, and made their way to Thessalon, where they were provided for. The Saronic was built at Sarnia in 1882, and was 252 feet in length. She was formerly the United Empire, and was in the passenger service until the 1914 season. On the present trip she was taking a cargo of grain to Port Nichol. She had no wireless, which caused the late report of the accident.

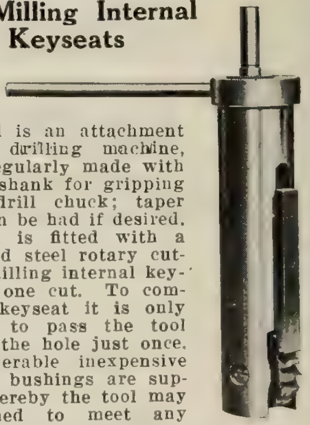
KEYSEATER

for Milling Internal Keyseats



This tool is an attachment for the drilling machine, and is regularly made with straight shank for gripping in the drill chuck; taper shank can be had if desired. The tool is fitted with a high-speed steel rotary cutter for milling internal keyseats in one cut. To complete a keyseat it is only required to pass the tool through the hole just once. Innumerable inexpensive eccentric bushings are supplied whereby the tool may be bushed to meet any diameter above its own.

Saving or Wasting?

The manner in which you handle the drinking water problem in your plant may seem to be a small matter to you —but investigate. The results will be surprising.

The old-time faucet is costly. Running hour after hour, day after day, its ceaseless flow is costing you money, yet without any better service.

Puro Saves 35%

A Puro Sanitary Drinking Fountain will cut that water bill 35%. We can prove that it has done that for others.

It will give every employee a safe, saner draught of bubbling water free from the contamination of the common drinking cup.

In a word, it is the only sanitary Drinking Fountain that is really safe, sanitary, simple, automatic in control, and easy to attach.

Railways—Bridges

Montreal, Que.—Blazing wreckage from two freight trains which collided on the C. P. R. line here fired the bridge carrying Notre Dame street and the tramway rails on Monday. The bridge was destroyed. Thirty-three freight cars were also burned up.

Vancouver, B.C. — Application has been made to Building Inspector McKenzie by the C.N.R. for a building permit for the erection of the main portion of its railway depot on the reclaimed lands of False Creek. The permit will be issued for $574,929. It does not include station platforms or butterfly sheds or freight sheds. The building will be 320 ft. by 105 ft. It will be ventilated by fans, and will be steamheated. There will be one passenger elevator and an ash hoist. The contractors for the erection of the building are the Northern Construction Co., and the Carter-Hall-Aldinger Co., Pratt & Ross of Winnipeg are the architects.

New Incorporations

James, Loudon & Hertzberg, Limited, have been incorporated at Toronto with a capital of $20,000 to carry on business as consulting engineers at Toronto.

Building Notes

Toronto, Ont.—The Canadian Bag Co. has taken out a permit for the erection on the north side of Paton road, of a two-storey brick factory to cost $40,000.

Toronto, Ont.—The City Architect has issued a building permit to the T. Eaton Co., to erect a one-storey brick factory on the south side of Bloor street, near Dufferin street, to cost $12,000.

Toronto, Ont.—The City Architect has granted a building permit to Northop and Lyman Co., Richmond street west, to erect a four-storey brick factory and warehouse at 66 Wellington street west, at a cost of $59,000.

The Pas, Man.—Tenders for the new courthouse to be erected here have been opened by Hon. Thos. Johnson, Minister of Public Works. Six bids had been sent in. The A. W. Cassidy Co., of The Pas, submitted the figure $37,500; Smith Bros. & Wilson, of Regina, tendered at $27,900 if common brick is used, and $9,000 more if Sydney pressed brick is the chosen material. Snyder Bros. will do the work for $35,879, using pressed brick. Sam Brown tendered at $41,036, and E. E. Snyder & Co. at $43,500. The Northern Plumbing Co. submitted a plumbing and heating bid of $8,417. The contract will likely be awarded in the near future.

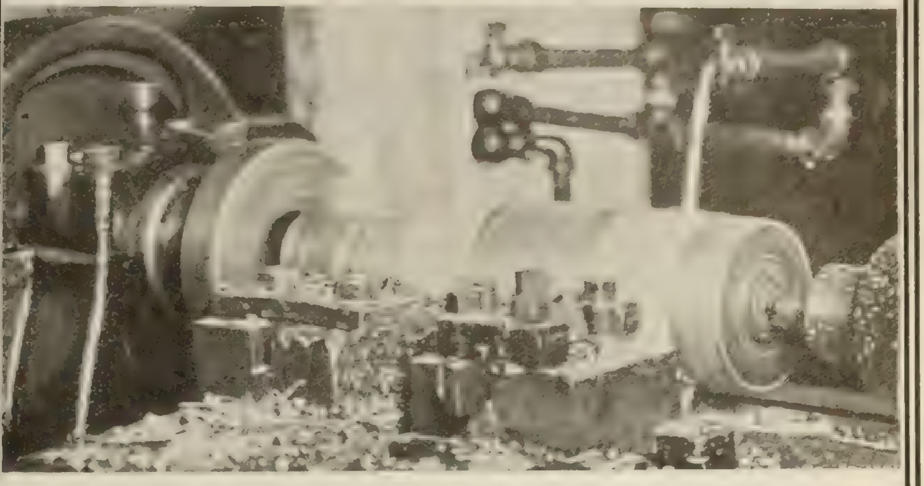
Wood-Working

Deseronto, Ont.—The Dominion Hardwood Co., contemplated rebuilding their factory which was destroyed by fire.

Catalogue

Grinding and Polishing Machinery.—Bulletin No. 11 illustrates and describes an interesting line of grinding and polishing machinery made by the Gray Mfg. & Machine Co., Toronto. A specification is included covering each type of machine, while other matter deals briefly with foundry equipment.

ECONOMIC WATER OIL



SHELL MANUFACTURERS use Economic Water Oil for Metal Cutting of every description, because it will not gum nor rust, and it Saves Time and Labor, and **BECAUSE One Gallon** of Economic Water Oil will readily mix with **30 to 50** gallons of Water, making a thick, creamy emulsion, giving you a cutting mixture which will not only be **satisfactory**, but will produce very **economic results. One TRIAL ORDER Will PROVE Our STATEMENT. MADE IN CANADA.**

STOW TOOLS ARE AN INVESTMENT AND NOT AN EXPENSE (8)

You Sell Something to Somebody

AND to that somebody you must make known — by advertising — what you sell, why it is good, and so on. Also, you must have a medium—a publication read by your customers or should-be customers.

All this you consent to without demur. What may perplex you a little is the **Medium** to employ.

This should not be a puzzle if your product or commodity is one purchased by the general public, and if your constituency of buyers is found everywhere in Canada.

The one medium of quality and of national circulation is

MACLEAN'S MAGAZINE

You can find no substitute for it at a lower cost, and none that will carry your proposals or announcement with greater acceptability.

The conclusion is plain.

N.B. Objectionable advertising not accepted. Both editorial and advertising columns are closely censored to keep them clean and decent.

FOR SALE COMPLETE WOOL HOSIERY PLANT

IN THE STATES IN WHOLE OR PART

One unit consists of 5 sets of woolen cards, 48 x 48; iron frames, 3 cards to set, with 8 J. & B. mules, 2-inch gauge, 280, 340 and 360 spindles; 2 double shoddy cards, Kitson rag picker, 36-in. Fearnaught mixing picker, wool duster, grinders, etc. In first-class shape, ready for immediate use.

Second unit—Ribbers, winders, loopers and footers sufficient for daily output of 800 doz. in misses' and boys' cashmere hose, and cashmere and wool merino half hose. Exactly suited for the Canadian market. Also complete dye plant.

All the machines are in A-1 shape, ready to run, and can be purchased for less than one-quarter cost of new, and arrangements made whereby the General Manager, who has been connected with the concern for several years and is thoroughly practical, would become interested and take active part in new company. Excellent reasons for selling. Address Box 215, Canadian Machinery. (8)

FAIRBANKS-MORSE New and Used Machinery

In Stock at Toronto

One 5' Bickford Universal Radial Drill; used.
One 7/8" 4-spindle National Acme Automatic; used.
Two No. 3 Foster Hand Screw Machines; new.
Four No. 4 Smith & Kamen Turret Lathes; new.
Three 14" x 5' Seneca Falls Lathes; used.
One 16" x 5' Seneca Falls Lathe; used.
Two 18" x 8' Springfield Lathes; new.
Ten [illegible] x 7' and 9' Fairbanks-Morse Lathes; new.
One Gisholt Universal Tool Grinder.
One No. 3 Cincinnati Milling Machine; used.
One No. 3B Milwaukee Universal Milling Machine; used.
Two No. 1 Racine Hacksaws; new.
One No. 304A Oster Pipe Machine; new.
One [illegible] x 8' Hendey Lathe; used.

In Stock at Montreal

3—16" F.M. Single Purpose Lathes.
1—Hendey 16" x 8' Lathe-taper attachment, Q.C.G., used
2—American 16" x 6' Tool-room Lathes.
2—Barnes 18" x 8' Lathes.
2—Walcott 20" Lathes, 3 Step cone, D.B.G. and Q.C.G.
3—Walcott 18" Lathes, 3 Step cone, D.B.G. and Q.C.G.
1—Rivett Precision Lathe.
1—Valley City No. 1½ Universal Miller.
1—Brown & Sharpe No. 1½ Universal Miller.
1—Ford Smith Plain Miller.
W. & M. Drill Grinder.
4' Niles Radial Drill.
Banfield Plug Miller.
Dill 15-18" Slotter.

This is only a partial list of our stock of Machine Tools.

GRINDING MACHINES

1 Wilmarth & Morman Universal Tool and Cutter Grinder (new).
2 Wells No. 190 Universal Tool and Cutter Grinder (new).
1 Wilmarth & Morman Style B-X Universal Cutter and Drill Grinder (new).
1 10" x 36" Landis Plain Grinder (new).
1 10" x 20" Landis Plain Grinder.
2 12" x 24" Modern Plain Grinders (nearly new).
1 14" x 50" Norton Plain Grinder (nearly new).
2 18" - 30" x 96" Norton Gap Grinders (nearly new).
2 Landis Internal Grinders with No. 75 Heald Heads (nearly new).
1 No. 70 Heald Internal Grinder.
2 No. 60 Heald Cylinder Grinders (nearly new).
1 16" x 66" Landis Crank Shaft Grinder (18 months old).
2 14" Swing Special Internal Grinders, capacity ½" to 14" dia. straight or taper.
1 New Yankee, style L, Drill Grinder (new).
1 No. 6M Besley Double Disc Grinder.
1 No. 360 Safety Emery Wheel Ring Wheel Grinder.

TURRET LATHES

58 Potter & Johnson No. 6-A Automatic (new).
8 Potter & Johnson No. 5-A Automatic (nearly new).
12 13" Gisholt Semi-Automatic (12 mos. old).
20 21" Gisholt Semi-Automatic (12 mos. old).
5 J & L two spindle (new).
1 J & L 2 x 24 with bar equipment, motor driven (fine condition).

MILLING MACHINES

1 No. 3 Garvin Universal (new).
1 No. 8 Becker Duplex (new).
1 No. 2 Rockford Hand Miller.
3 No. 0 Bristol Hand Millers.
1 Newton Duplex with 72" table feed.
1 No. 3½ Becker Vertical with Dividing Head.
1 Small Duplex Miller.
1 No. 4 Hendey type Lincoln Miller (nearly new).

DRILLING MACHINES

1 8-spindle Bausch Multiple, 1" capacity.
1 12" Spindle Garden ½" capacity.
6 Barnes 24" 2-spindle All Gear Drive (new).
1 24" Hoefer Sliding Head (new).
4 Henry & Wright No. 1 style K (nearly new).
12 Colburn Heavy Duty, size D-2 (new).
27 Colburn Heavy Duty, size D-4 (new).
1 26" Rockford Sliding Head (fine condition).
3 4-spindle Dwight slate, 14" swing, ¾" capacity.
2 Peerless 20" (new).
1 20" Mechanics (new).
1 20" Buffalo (new).
1 28" Hamilton Sliding Head.
11 Burke No. 1 Bench (new).
1 25" Kern Sliding Head with Tapping attachment.
362 Paragon High Speed Drills, 1¾" x 14" flute, 21" over all (new).

RADIAL DRILLS

1 36" Dreses, with quick return tapping attachment (fine condition).

ENGINE LATHES

38 16" x 8' Fairbanks-Morse (new).
1 18" - 36" x 8' Fay & Scott Extension Gap (fine condition).
1 30" x 12' LeBlond.
1 12" x 6' American.
1 28" x 14' Fifield.
1 14" x 4' Blaisdell.
1 No. 4½ Barnes.
1 54" x 21' Detrick & Harvey.
1 26" x 10' Bradford.

MARKING MACHINES

2 Noble & Westbrook No. 1 (new).

PROFILERS

1 No. 3H Becker (new).

PLANERS

1 30" x 30" x 10' Ohio with two heads (new).
1 44" x 44" x 12' L W Pond with three heads.
1 40" x 40" x 12' New Haven, with one or two heads.
1 36" x 36" x 12' Sellers widened to 72".

AUTOMATIC GEAR CUTTERS

1 No. 3 Brown & Sharpe 26" (old machine).
1 36" x 4" Fellows Gear Shaper (fine condition).
1 18" Schuchart & Schutte Tooth Rounder (nearly new).

CUTTING OFF MACHINES

1 4" Hurlbut-Rogers Cone Drive (fine condition).
18 Newton No. 500 Gold Saw Machines with 20" inserted tooth blades (new).

BELT LACING MACHINES

1 12" Jackson (new).

KEY SEATERS

1 No. 1 Catlin (new).

SCREW MACHINES

1 No. 3 Stecher (new).
1 1" x 8" Pierce (new).
3 No. 2 Southworth (nearly new).
4 No. 2 Warner & Swasey, with power feed turret (nearly new).
4 No. 54 1⅜" capacity National-Acme (used two years).
1 No. 4 B. & O. power feed turret, friction back gears.
1 No. 4½ B. & O., power feed turret, friction back gears.
1 2" x 24" Jones & Lamson Motor Driven (fine condition).
1 No. 6 Warner & Swasey 2¼" capacity back geared but no power feed to turret (nearly new).

BROACHING MACHINES

1 No. 3 La Pointe (nearly new).

BOLT CUTTERS

1 2" Landis Double Head (nearly new).

BORING AND TURNING MACHINES

1 4' Bickford Boring & Turning Mill (nearly new).
1 20" swing 4-Spindle Moline Vertical Boring Machine with 18" x 36" table.

BULLDOZERS

1 No. 4 Williams White (old).
1 No. 1 Williams White.

FILING AND SAWING MACHINES

1 Large Filing and Sawing Machine with 12" stroke.

PUNCHES AND SHEARS

1 No. 3 Walsh Punch Press.
1 Moser 1½" stroke Punch Press with Automatic Feed.
1 No. 17 Williams White Double End 8" throat capacity ¼" x ¼".
1 27½" throat lever punch ½" capacity 1¼" stroke.
1 Thompson Bevel Shear ½" capacity.

PIPE MACHINES

1 6" Saunders.

SHAPERS

1 14" Hendey Geared Friction.
1 20" Hendey Geared Friction.

TAPPING MACHINES

1 Garvin No. 1 Automatic (new).
4 Geometric High Speed Tapping Devices, style N (new).
4 Murchey 2" collapsible taps (new).

THREAD ROLLING MACHINES

1 Waterbury Farrell ⅜" capacity (nearly new).

THREADING MACHINES

5 Special Threading Machines for threading 3" steel shells (nearly new).

SPOT WELDERS

1 No. 3 Toledo Type 14-A 220 volts 60 cycles (nearly new).

"Keep Wheels Dressed" is just as important as "Keep Tools Sharp"

Diamo - Carbo Grinding Wheel Dressers are the economical substitute for the Black Diamond Dressers. They are so low-priced that each grinding stand may be provided with its own Dresser. Sherman-Huntington—For use on large and coarse wheels upon which the Diamond cannot be used, the Sherman-Huntington is the most satisfactory Dresser ever designed. Made in three sizes with either Corrugated or Toothed cutters. The No. 2 with Cutters 2⅜" in diameter is a wizard for use on the hardest wheels. Provided with hood to protect user from flying particles.

We also manufacture Diamond Dressers

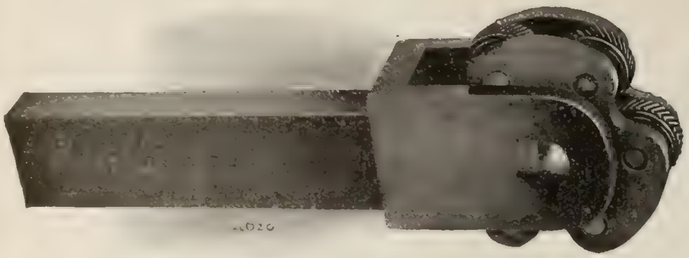
LET US QUOTE YOU ON SPECIAL SHELL MACHINERY AND EQUIPMENT

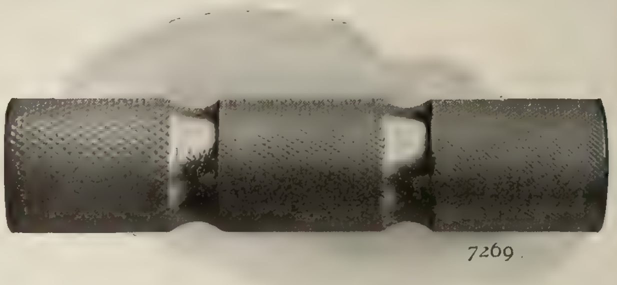


Don't Waste Time Changing Knurls

and don't be bothered with three holders when one will do.

Use the P. & W. "Three-in-One" Lathe Knurling Tool

Carries three pairs of knurls, making it three distinct knurling tools in one.



Coarse, Medium and Fine

The three pitches of knurls which we carry in stock are all combined in this one tool.

Uses same knurls as regular Lathe Knurling Tool shown opposite.

Same Holder for Chasers and Single Point Cutters

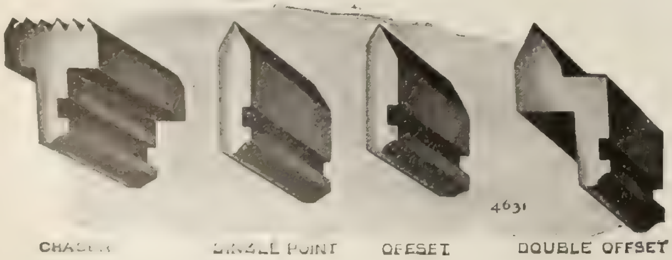
and the change can be made in a jiffy on the

P. & W. Threading Tool

A Few Of Its Advantages

1. Threads can be cut very close to a shoulder.

2. Tools are sharpened by simply grinding off top of cutter.



3. Combines economy with all features essential in a threading and forming tool.

4. Cutters have 15° clearance which experience has taught gives the longest wear in various metals.

Place a trial order with our nearest store.

The Wisdom of Advertising When Oversold

ASK the "man in the street" to call the roll of talking-machine manufacturers, and he will name three almost certainly, four probably, and perhaps will go as far as five or six before his knowledge of the subject is exhausted. But ask him for the name of the leading concern in the industry and ninety-nine times out of one hundred you will get the same answer. The wisdom of the Victor Talking Machine Company's policy of continued advertising when the factory is oversold can be demonstrated by so simple a test as that.

Our neighbor, the Dry Goods Economist, points out that the talking-machine business is no longer a specialty proposition, requiring expert handling. The public at large is so thoroughly familiar with the idea of owning a machine and operating it that the department store can profitably enter the field and sell the line on a merchandise basis. And certainly there are plenty of available sources of supply. We counted the ads. of twenty-six different manufacturers in a single issue of a trade-paper, and that is by no means the complete roster. Some of them are also advertising to the consumer, others are not, yet the fact remains that the immense prosperity of the industry is attracting a multitude of concerns which intend to share it if they can. The leaders have done the pioneer work of educating the public to the talking-machine idea, and now let them look to their laurels!

The same thing has happened before in many other lines of business. We can name concerns which once were leaders, but which have gone down under the pressure of just such competition as is now threatening the talking-machine industry. Prestige meant little to them so long as they got the business; they felt that their standing was secure because the factory could not keep ahead of its orders. They regarded advertising as a useful means of getting more business, but why advertise when we don't need business?

There is little likelihood that the leaders in the talking-machine industry will be deposed, for they have not advertised merely to "get business." Their advertising has represented in large part an investment in good-will—the laying up of a fund of public confidence which could be drawn upon whenever it became necessary. The wisdom of that policy will become more and more apparent as time goes on.—Printers' Ink.

"Stellite" Tools

will give you the most startling demonstration of turning you have ever seen. No metal too hard, no work too heavy.

STELLITE

MADE IN CANADA
STELLITE

IS NOT A STEEL

It is an alloy so hard that it will perform every operation at a higher speed than is possible with the best speed tool steel,

Do you see what this means to you? *A direct increase of capacity of every lathe in your plant.* Increasing the productivity of every lathe hand, lowering labor cost on every piece produced, lowering proportionate overhead.

It does not require near as much grinding, therefore it lasts longer and saves much of the operator's time.

Let Stellite tool metal show you that it's a big step in advance of high speed steel—try it.

For Turning, Facing and Milling the Thread on Gas Check Plugs for 6-inch High-Explosive Shells.

THE BANFIELD PLUG MILLER

Patents applied for in Canada and United States

THIS machine is especially designed for finishing base plugs, turning the outside diameter, finishing the face with any camber desired, and milling the thread, all in one chucking, the complete plug being finished in six minutes by unskilled labor.

The machine is equipped with quick draw in collet. Drive pulley 18" x 6", with bronze bush having cut jaw clutch for turning and facing. Worm gear 100 to 1 ratio, with cut jaw clutch for milling, driven by 10" x 1½" flanged pulley. The milling cutter is driven by an 8" x 2½" flanged pulley. Tool post carriage is equipped with power feed (two speeds) having automatic stop. Power feed pump with relief valve driven from worm shaft **(all drives direct from main line shaft).** Rigidly built, simple and economical to operate.

Weight 1,800 lbs.

For 18 pdr., 4.5 and 60 pdr. High Explosive Shells, Can furnish machines of same type, but somewhat lighter in construction. Particulars on request.

These machines are tooled up for finishing plain machined plugs if desired.

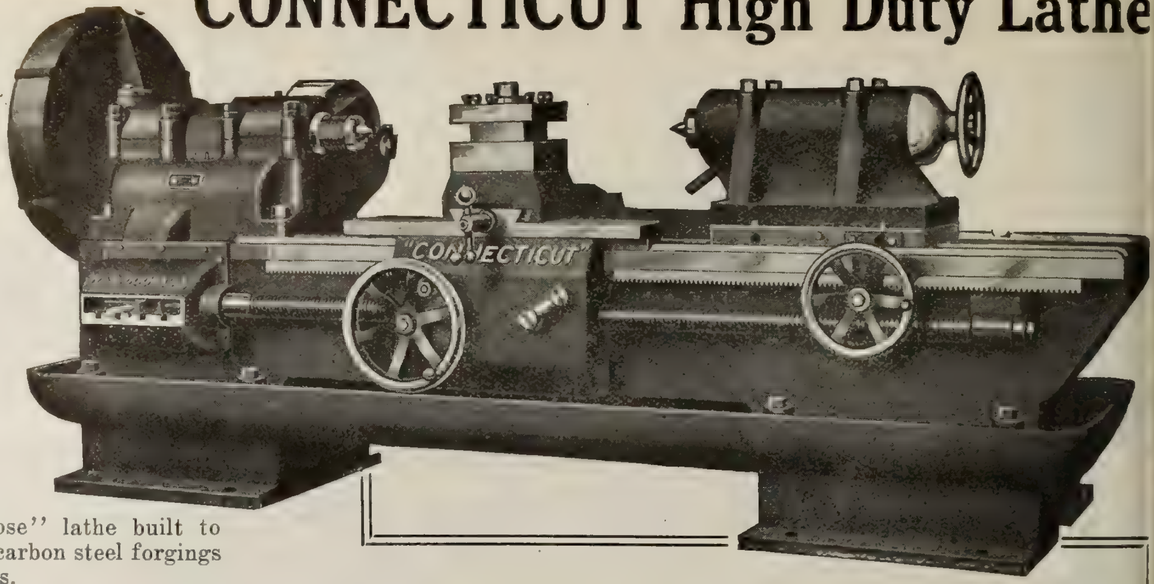
JOHN T. HEPBURN, Limited, 18 to 60 Van Horne St., Toronto, Can.

CONNECTICUT High Duty Lathe



Sets the pace on HEAVY WORK

A "Single Purpose" lathe built to turn or bore high carbon steel forgings at maximum speeds.

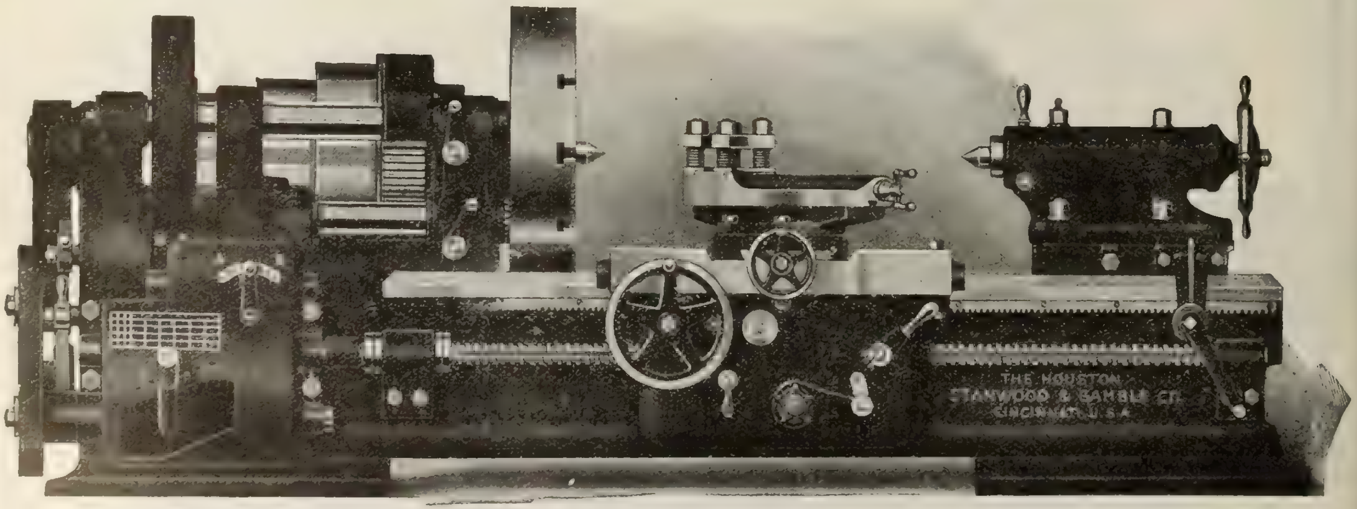
It is in all respects heavier and more rigid than standard 30-inch or even 36-inch lathes giving the same distance between centers.

The usual cutting speeds on shell work are 40 to 50 feet per minute on shells up to 8" diameter, 30 feet per minute on larger sizes. Depth of cut from ¼" to ⅝", depending upon the eccentricity of the piece. Our lathes will stand more than this.

We admit the **Big Gear** is not particularly handsome, but it eliminates the train of small gears, and adds greatly to the strength and wearing qualities.

Write for bulletin giving full details.

W. & B. DOUGLAS, *Middletown, Conn.*



H-S-G TRADE MARK

Heavy Duty Engine Lathe, triple-geared into internal gear on face plate. Prompt shipment in 30" and 36" sizes.

This is a well-designed lathe. The cone has 7" face for 6" belt. Spindle has 8" x 10" front bearing. All parts are of correspondingly liberal proportions. Absolutely all gears are of steel. The net weight of the 30" lathe with 14' length of bed is 16,500 pounds. The design, materials and workmanship are excellent.

No. 2-A—With "Bar Equipment"

Separate feed shafts, each with ten individual feeds, operate the carriage and turret saddle independently, and provide the exact feed required for each.

And to this great advantage are added the other essentials for rapid and accurate production—excess power, extreme rigidity, great adaptability, and a power rapid traverse that saves time and conserves the energy of the operator.

Without obligation, ask us to show the saving on one of your typical jobs. Send blueprints with rough and finished samples.

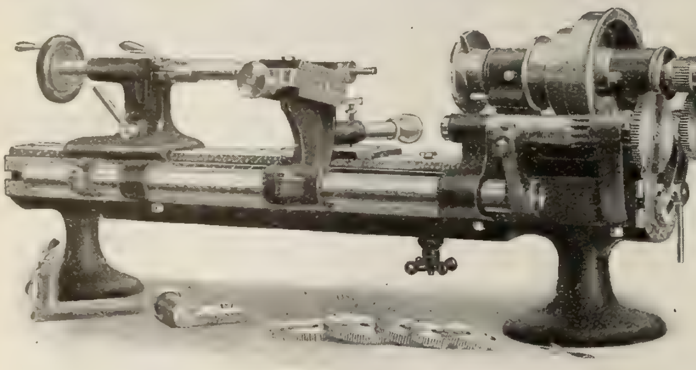
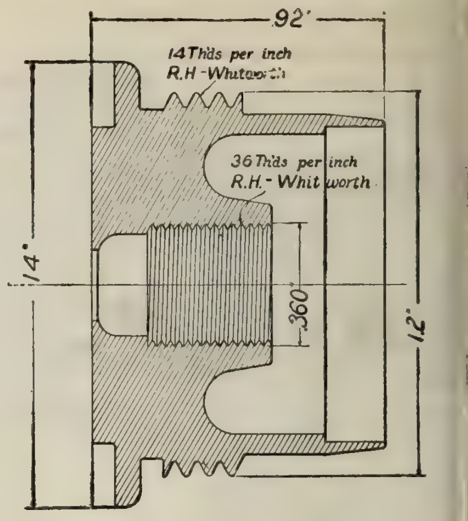
THE CATARACT BENCH LATHE WITH CHASING ATTACHMENTS





We have sold many of our lathes to Canadian concerns who are eminently satisfied with results. Will you be next?

For work requiring greatest accuracy and rapidity, THE HARDINGE CATARACT BENCH LATHE will not disappoint you. Machine equipped with Automatic Chuck Closer for rapid operation of chuck, and with chasing bar arranged with multiple point, chasing tool is producing from ten to twelve hundred 14-pitch Whitworth threads on primers in TEN HOURS. Prompt deliveries. Catalogue No. 15 is ready to mail TO YOU. You are invited to write for it to-day.

HARDINGE BROTHERS, Inc., 1770 Bertau Ave., CHICAGO, U.S.A.

Davenport 22-Inch Lathe — For Extr
Heavy Service

These lathes are built exceptionally rigid and heavy. No feature has been omitted, to secure great strength and power. The bed, the headstock, the tailstock, the carriage—every detail has been designed and constructed with a view to driving the heaviest cut that any tool will stand up against. At present we can make quick deliveries on this machine.

Built with ordinary change gears unless otherwise specified.

Write at once for Bulletin. It gives full details of construction.

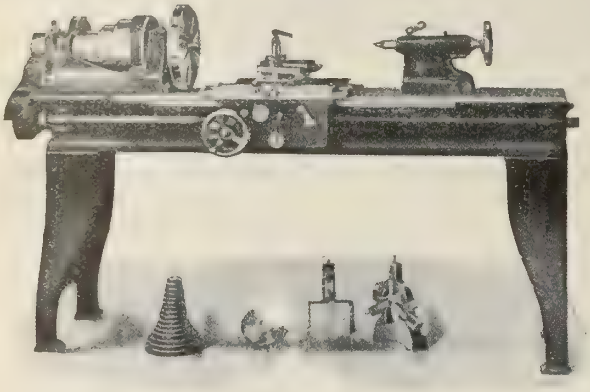
The Improved Power Hack Saw

MADE IN CANADA

will cover its cost many times over with the money it saves through long, efficient service.

Saws bars 6 x 6 in., either round or square, and is so constructed as to require no attention after work is put in vise, and stops automatically when piece is cut off.

The Improved Saw Guide is a Special Feature — it keeps the saw perfectly in line at all times.



The "McKenzie" Engine Lathe

The Standard of Accuracy

Made from new patterns, of improved design, and constructed of the very best material by expert workmen. Every part is mechanically perfect and excellently finished.

Its accuracy and durability mean a big saving of money to you.

HUNTER SAW & MACHINE COMPANY, Pittsburg, Pa.

One Paragraph From A Machinery Dealer's Letter:-

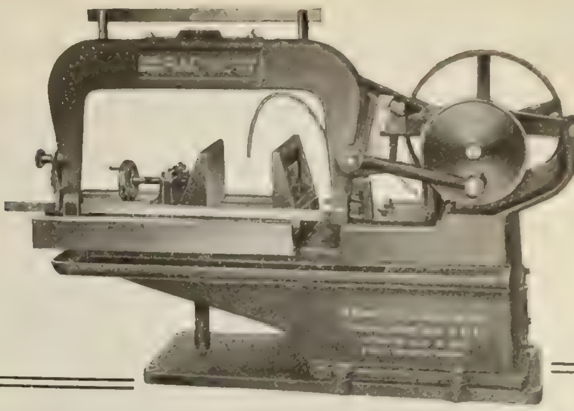
PEERLESS
PEERLESS MACHINE CO. RACINE, WIS., U.S.A.

"One of our customers has recently purchased from us two of your 6" PEERLESS High Speed Power Hack Saws, and they now wish to install several more, providing we can take some of their old hack saws in exchange. They claim these old machines are as good as new, but they consider the PEERLESS so far superior to the others that they would like to fully equip their factory with PEERLESS Machines."

The principle of construction in the PEERLESS High Speed Heavy Duty Cutting off Machine admits of a cutting speed which cannot be approached by the ordinary type of machine. The output of this machine is controlled by the efficiency of the blade. At the maximum speed which this machine is guaranteed to operate it cuts off a 3 in. semi cold rolled bar in 1½ minutes.

Bearings are extra large. The ones that are subject to excessive wear are made of steel, hardened and ground, which eliminates the continuous adjusting and repairing that ordinarily is the case when a machine is worked to its utmost.

PEERLESS MACHINE COMPANY
1607 Racine Street RACINE, WISCONSIN



ONE BLADE on this machine does what SIX of the same kind will do on any other

The Racine Metal Cutting Machines are exceedingly easy on the blade, BUT THEY FAIRLY EAT THE METAL.

One reason for the greater blade life is the Positive Automatic Lifting Device which lifts the blade clear of the work on the non-cutting return stroke.

Another reason is the Saw Frame Guide which positively prevents springing, and insures greater accuracy and there are many other reasons that we will be pleased to put before you.

The Racine is a metal cutting machine that will effect an immense economy in your plant.

Many Canadian plants are on our list of users. One Canadian Steel Company is using **120 Racine machines** and has saved $11,019.00—particulars of saving will be sent on request.

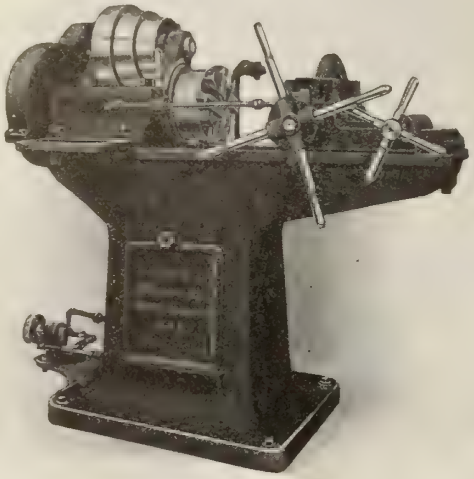
BRANTFORD, CANADA

The Simple Job is Often the Real Test



Don't think that you must have requirements covering special threads to install a Landis Bolt Cutter.

Remember that a good quality of thread on your standard product together with a high production and a low cost of upkeep is essential to profitable threading. To obtain this profit you must have a machine which will give the best results at all times.

The Landis Die is designed to give uniform satisfaction on all classes of work and under all conditions. The many repeat orders which we get from shops where efficiency is the practice, is sufficient testimony that the Landis is producing the desired results. Its many distinctive characteristics are bound to give you a better quality of thread, a high production and a lower cost of upkeep than you can obtain with any other threading tool.

Let us have your specifications at once, no matter how simple, or how special, just so it is thread cutting. It will be worth your while to investigate our claims.

In Service Several Years—*but as accurate and fast as ever*

One of the four Turner Turrets owned by the A. O. Norton Co., Boston, one of which is in operation at their Canadian plant at Coaticook, Quebec.

The casting is a malleable iron socket for a 100 ton Norton Jack. The operations are: 1st Spindle, drill 1⅛", hole through two ¾" sections. 2nd Spindle, a double cutting tool reams the lower section and counterbores the upper section. 3rd Spindle, drill a 5" hole 2¾" deep. 4th Spindle, drill ¼" hole through two ¼" lugs. 5th Spindle, drill 5-16" hole ½" deep. 6th Spindle, drill 3-16" hole and counterbore to ½". **And all this work is done on the Turner Turret in 8 minutes.**

The

TURNER TURRET

is built in several sizes, and is designed especially to perform several operations upon a piece of work at a single setting. On all work within its range it is more economical than a big chucking machine because its initial cost is about half that of the larger tool. Also, it is fast—and accurate, because it performs its work at one setting of the piece. The TURNER TURRET is a rapid producer on shell parts.

Mail us your blue prints, and let us give you estimates on the Turner Turret. Ask for catalog

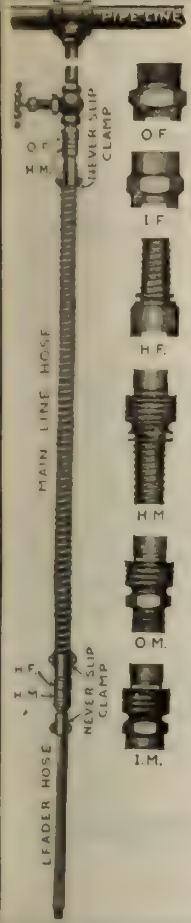
CLEVELAND HOSE SPECIALTIES



Bowes Automatic Air Hose Couplings

Over 1,000,000 in general use

STYLE O.F. is an Outside Thread Female Pipe End. Made in sizes ⅜-in. to 1½-in.

STYLE I.F. is an Inside Thread Female Pipe End. Made in sizes ¼-in. to 1½-in.

STYLE H.F. is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.

STYLE H.M. is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.

STYLE O.M. is an Outside Thread Male Pipe End. Made in sizes ⅜-in. to 1½-in.

STYLE I.M. is an Inside Thread Male Pipe End. Made in sizes ¼-in. to 1½-in.

The Male and Female Ends of Bowes Couplings interchange in sizes, ¼-in. to ¾-in. Sizes 1-in. and 1¼-in. interchange. The 1½-in. ends interchange only with themselves.

BOWES COUPLINGS

Are instantly connected or disconnected.

They are absolutely air-tight under all pressures.

They quickly pay for themselves by stopping costly leaks.

They interchange in sizes most commonly used.

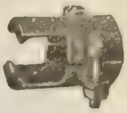
They have no loose parts to be mislaid or lost.

They are made of brass and will not rust.

The U-shaped interchanges in couplings ¼-in. to ¾-in.

The Cleveland Never Slip Hose Clamp

Made in same sizes as Bowes Couplings

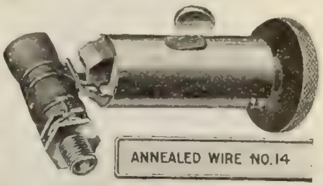


The adjoining cut of Never Slip Hose Clamp shows the "Flanges" which engages the groove provided in all hose ends of Bowes Couplings. The "Model Hose Line" illustrated shows correct styles of couplings to use and proper way to attach the clamps.

CLEVELAND GROOVED HOSE NIPPLE

Grooved Nipples when attached to hose with the wire clamp cannot "blow-out," as one half of the Wire Clamp lies in Nipple Groove, and the other half on the hose, uniting nipple and hose permanently. "Blow outs" are expensive, as one to five men are idle while new connection is being made; time wasted, ten to thirty minutes. Can you afford it?

WIRE CLAMP TOOL



To apply Wire Clamps to Grooved Hose Nipples you need the Wire Clamp Tool illustrated, a small hand-operated tool at moderate cost which we carry in stock for immediate delivery.

In Stock: Riveting and Chipping Hammers, Four-piston Air Drills, Corner Drills, Emery Grinders, Sand Rammers, Holder Ons, Etc.

WRITE FOR BULLETIN NO. 29.

IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and stop costly leaks.

Write for Catalog No. 12, which illustrates our complete line of Air Tools.

The New "Murchey" Adjustable TAP

MURCHEY MCH.& TOOL CO.
DETROIT, MICH.
2"-14
WHITWORTH

POSITIVELY ACCURATE

10 times the life of the ordinary tap

With the Murchey Tap and chasers can be ground any number of times and adjusted each time to compensate for wear. One set of chasers will last ten times as long as a solid tap, and new chasers can be replaced at low cost.

Now with the solid tap it is an entirely different matter. Just as soon as you begin to sharpen a solid tap, it loses size and accuracy, and after one or two sharpenings the tool is of no further use.

This new Murchey Adjustable Tap is working finely and we are receiving a great number of orders for it. Send in yours to-day—the price is of no consequence considering the remarkable results and economies shown in length of service.

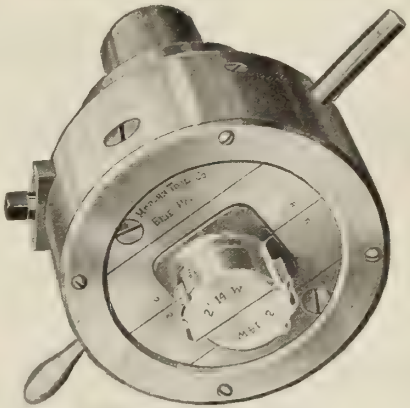
Modern Self-Opening Adjustable Die Heads and Collapsible Taps

Modern Self-Opening Die Head.



Modern Collapsible Tap.

"Modern," Self-Opening Die Heads and Collapsible Taps in your thread-cutting department mean efficiency and accuracy. With "Modern" Dies and Taps it is not necessary to take a roughing cut—a single cut gives a finished thread of absolute accuracy in diameter, form, lead and pitch. They are properly supported to insure the cutting of a perfectly straight thread of full size and accurate lead, and will not clog with chips, necessitating frequent cleaning. Cuts close to a shoulder.

"Modern" Die Heads and Collapsible Taps are used on all styles of Hand and Automatic Screw Machines, Turret Lathes, Chucking Machines, Drill Presses, in fact on any Machine that is used for thread-cutting.

Magic Chuck Equipment

The simplest, safest, easiest to operate and most adaptable chuck on the market. For use on Drill Press, Lathe, Screw Machines and other Revolving Spindle Machines.

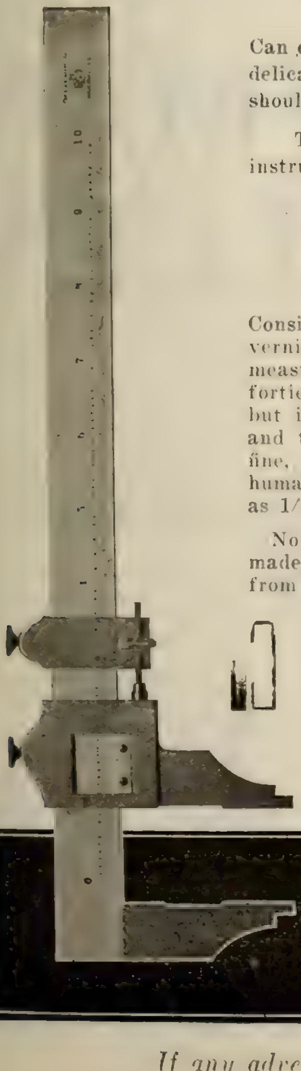
What Makes a Vernier Caliper Accurate?



Can one vernier caliper be better than another? Is there a difference in the quality of such delicate instruments as this? If accurate government standards are accessible to all, why should one instrument be superior to another?

The answer is just this—the quality of the graduations determines the quality of the instrument and the cleanest, sharpest graduations are found on

Starrett Vernier Calipers

Consider that the finest graduations on a vernier caliper are 1/40 of an inch. To measure thousandths of an inch, these fortieths must be split into twenty-fifths, but if the graduations on the fixed scale and the vernier plate are not sharp and fine, it is physically impossible for the human eye to discern adjustments as fine as 1/1000 of an inch.

Now, while our vernier calipers are finely made, with accurately graduated scales from carefully selected and hardened steel, and with fine workmanship, we leave our whole claim for actual supremacy to the man who examines the graduations of the tool and finds them cleaner, finer, and sharper than any he ever saw before.

Look at those graduations under a microscope and see for yourself if they are not cleaner, daintier, and snappier than you have seen before. Then decide whether you will trust really accurate work to any but Starrett Tools.

Catalog 213 contains 336 pages of fascinating reading for the man who loves tools. It's free to men interested.

SIMPLE and inexpensive—light and easy-running — strong and durable—the Lyman Munition Trolley saves labor, time and costs in handling shells. It has more than made good in the plants where it has been introduced.

For tracks it uses 2" planks, faced with ¼" steel, as illustrated. These are quickly erected, at trifling cost.

The track wheels are fitted with double-row ball-bearings, which take care of thrusts due to side-sway, and reduce friction to a minimum.

This LYMAN MUNITION TROLLEY

Speeds Up Shell Making

Used with our "CYCLONE" Chain Hoists and new, quick-acting Shell Tongs, the Lyman Munition Trolley handles shells with surprising ease and speed, increasing output and reducing costs.

Its simplicity enables us to offer the LYMAN Munition Trolley at a most attractive price. Write or 'phone us for particulars.

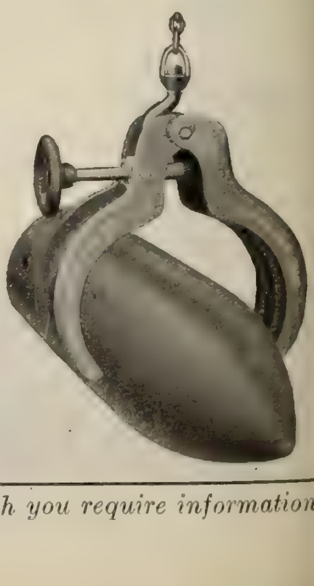
Cyclone Shell Tongs



"FULFLO" MACHINE TOOL Lubricant PUMP

You can drive your machines faster

but your cutting tools won't stand it — the speed burns them up.

A cutting tool will stand up to higher speed and heavier feeds, providing it is kept cool.

The "FULFLO" Machine Tool Lubricant Pump supplies a good "HEAVY" stream of compound sufficient to carry away all the heat.

No gears or other close-fitting parts to be affected by the grit, dirt, or small chips that are always present in the coolant. No clogging.

The only working part is the impellor. Since no check valve, reverse valve or any other kind of valve is present in the pump or pipe, other than the stop cock, the usual valve troubles are eliminated.

Easily attached to any machine. **Insist that the new machines you buy be equipped with the "FULFLO."**

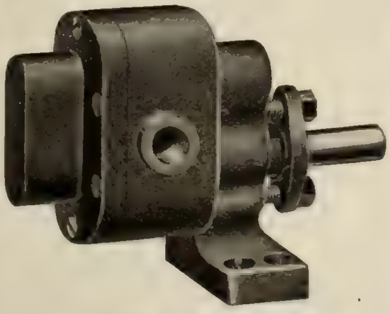
ROPER Circulating Oil Pumps

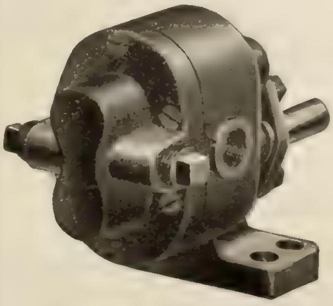
Whenever you are in the market for oil pumps, we ask you to investigate the pumps of our making. A long and wider experience, joined to Specialization, have pre-eminently fitted us for the making of this line. We meet with literally thousands of buyers and users and have the benefit of their knowledge and judgment. Our pumps are suitable

FOR ANY MACHINE

being made in five sizes. Two of our three models are illustrated in this advertisement. The action of these Roper Pumps is extremely simple, consisting of two accurately cut steel gears running in a tight chamber. There is nothing to get out of order.



Type 1 One-way



Type 2 One-way

Type No. 1. ONE WAY is specially designed for use on machines in which the cutting tools operate constantly in one direction.

Type No. 2. ONE WAY is designed for use on machines where the delivery is cut off or varied with the pump running. Both models supply oil to the cutting tools at exactly the required rate. We also make reversing pumps in both types.

WRITE FOR FULL INFORMATION

concerning these pumps. Our strong arguments with users are: simplicity, economy and perfect service. We surely have the right article.

Tell us of your needs. If you have complaints or criticisms or suggestions to make send us them. We are out to meet difficulties and solve them – for the common good.

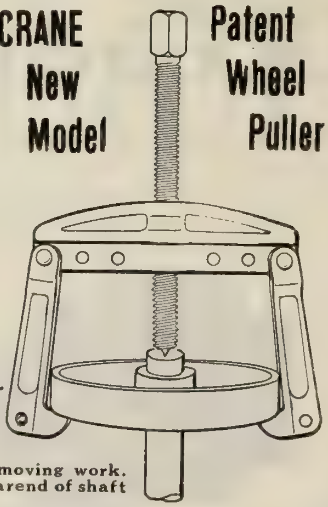
CRANE New Model **Patent Wheel Puller**



Removing work. nearend of shaft

For Removing

Transmission and Cam Shaft Gears, Auto Wheels, Fly-Wheels, Sprockets, Collars, Couplings, Propellers, Universal Joints.

For straightening Shaft, Bending Pipe, etc.

The Screw has a flat end with inserted tempered tool steel point that will not spread centres. Makes its own centre on work that has none. The strain is taken on the flat end of the screw. Grease to keep from cutting. The screws are made of high carbon steel and case-hardened all over. All Pullers are furnished with two sets of new combination hook extension arms.

The Pipe Bending Attachment is indispensible in a repair shop for straightening propeller and jack shafts, bending exhaust pipes, and removing universal joint yokes, etc. Drop a line for full particulars.

ANACONDA BELTING

This photo was taken in a large shell shop "Somewhere in Canada."

All the belting you see is "Anaconda"—6000 ft., 1″ to 12″, in 4, 5 and 6 ply, was supplied by us.

Machines are working on 6″ shells.

Call at our Booth, in Machinery Hall, Canadian National Exhibition, Toronto, Ont., and secure one of our Catalogues, with full information.

"Anaconda" way, makes belts more waterproof, with less slip, less stretch and of greater general serviceability than any other belt of any kind.

"Anaconda" Belting reduces belt repairs and "take-up" to a minimum and materially increases the mechanical efficiency of the plant.

The right belting for Heavy Duty Drills, Grinders, Turret Lathes, etc., that use liquid cutting compound, because it is filled with a composition to withstand heat and acid, which also makes it waterproof.

"Anaconda" will deliver you more service per dollar than any other type of belt made. A trial is convincing.

TRADE MARK

SAVES "SHUT DOWNS"

GUILER SAND CO.,
KINGSTON, PA.

January 24, 1916.

I am very glad to say that I am a user of Magnolia Metal, and a satisfied one.

Furthermore, I have put this metal in three places where other metals failed; one place that caused us to shut-down several occasions at the busiest time. This special place is a 30" Cylinder of a separator that we use to break the sand and to mix the different grades. It travels 1,150 r.p.m., and will test any metal in speed and grit.

We have had very little trouble since using Magnolia and find that it does not cost half as much as other metals that we have used.

I never found any fault with Magnolia that caused me any trouble and at the end of the year I found my babbitt bills were just about half as much as before.

Yours very truly,
D. C. BOYLE,
Manager Guiler Sand Co.

Completely equipped with Silent Chain Drives

"MORSE" Of Course

The illustration shows a shop where each machine has its individual countershaft, and each countershaft is driven by an electric motor through a MORSE Silent Chain.

This method of driving machines permits most convenient mounting of both motor and countershaft and assures a positive speed ratio between the two.

The MORSE Chain on the first reduction eliminates belt slip and lost power, and the grinding noise of gearing at high speed. With a sustained efficiency of almost 99 per cent. the chain assures maximum productive capacity at all times and at any speed.

Among the many notable shops and factories lately equipped with MORSE Silent Chain Drives are Remington Arms & Ammunition Co., 390 drives averaging 24 h.p. each; Morrow Mfg. Co., 86 drives averaging 22 h.p. each; American Graphophone Co., 24 drives averaging 27½ h.p. each; Brown-Lipe Chapin Co., 13 drives averaging 35 h.p. each; etc., etc.

Remember, these firms pay more to get MORSE Chains than they would pay for any other make. Would they buy in such large quantities if there was any question of value?

Our free bulletins give reasons for the decided preference for MORSE "Rocker-Joint" Chains for both large and small powers. Copies mailed upon request.

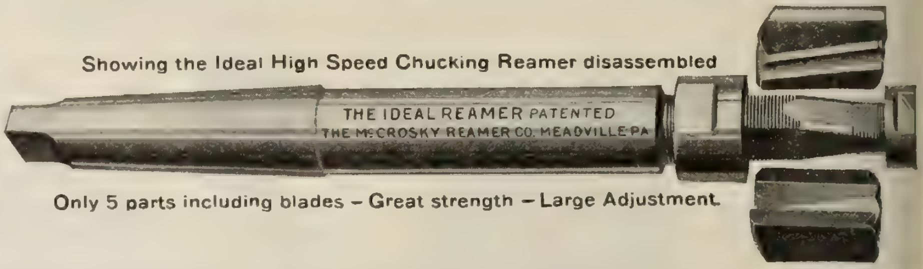
ARE REAMED WITH EASE WITH

THE "IDEAL" ADJUSTABLE REAMER

Every hole is reamed true, smooth, and round. There is no binding, heating up nor clogging with chips. It is without equal in most classes of machine reaming.

We recommend **THE IDEAL** for any job in phosphor bronze, steel tubing, steel castings, steel forgings, aluminum or any job you may have where other reamers have failed.

Showing the Ideal High Speed Chucking Reamer disassembled



THE IDEAL REAMER PATENTED
THE McCROSKY REAMER CO. MEADVILLE PA

Only 5 parts including blades – Great strength – Large Adjustment

A 2″ **IDEAL** Reamer will adjust 3/32″ and other sizes in proportion. Thus one Ideal will outwear a dozen or more solid reamers, and then it is only necessary to buy a new set of blades.

THE IDEAL is radically different in design from all other types of adjustable reamers. Two solid blocks of High Speed Steel held on an arbor by two powerful collars—nothing more. No screws or small parts. There are four left-hand spiral cutting edges, and every tooth is milled in the solid head—no inserted teeth. Greater simplicity and strength is impossible in an adjustable reamer.

Adjustment is effected by loosening rear collar and tightening front collar, which forces the two halves of the reamer head up the inclined surfaces of the arbor. No shimming under the blades.

Assembled

Limit Gages

CRESCENT CYLINDRICAL GAGE

The Improved type of Crescent Gage with broad, flat bearing surfaces has proved to be a most efficient gage for many kinds of external, particularly cylindrical measuring. The use of the generous bearing surfaces has eliminated the uncertainty experienced with the small points.

SCREW THREAD GAGING

The Limit System, as shown above in the Fork Gage, is the efficient, economical way of checking threaded parts that are turned out in quantity. The cone-shaped points are set to predetermined limits, and may be sealed by the chief inspector to prevent tampering. There can be no guesswork about it. The work must be uniform.

WELLS BROTHERS CO. OF CANADA, LIMITED
GALT, ONTARIO

Grinding Tapered Bodies of Connecting Rods

One of the largest gas engine and pump manufacturers in the middle west grinds tapered bodies of connecting rods to get good finish on these parts. It is putting in extra work not necessary for accuracy, therefore big production is required.

The photograph shows the machine grinding one of these rods, the tapered body of which is 30 inches long. The shaft is a drop forging, the finished small diameter is 1⅜ in., and the large diameter 1⅞ in. From 0.020 in. to 0.030 in. is removed—enough to clean up all lathe tool marks—the rod coming to the grinding machine after a roughing lathe cut only has been taken.

The wheel used is a Norton Alundum, 24 x 2 x 5 in., grain 24, grade M, running at a periphery velocity of 6,000 ft. per minute.

HIGH EXPLOSIVE SHELL MANUFACTURE

Equipment, Methods and Devices for Producing 6 in. Shells

Staff Artiele

While this is by no means the first descriptive article to appear in these pages covering the production of 6-inch high explosive shells, it may not be assumed that repetition of equipment and operation data figure to any appreciable extent. With the development of the munitions industry, it is but reasonable to expect a relatively increased display of inventive genius in the directions of greater quantity and higher quality output. The accompanying article, we believe, is so expressive, and may be taken as typical of Canada's munition industry.

WHEN the production of munitions was first considered by our Canadian manufacturers during the early stages of the war, many of the experienced in metal working industries, were dubious of the success of the venture. However, time and perseverance has shown that this country was not only capable of producing shells, but after a few months of experimental work, and close attention to the details of the specifications, the factories in Canada began to set the pace for those of other countries. Not alone to the metal plants however, is the entire credit due, for in many instances, the greatest success has been achieved by those, who up to the time of shell making, had been engaged in an entirely different line of activity. The plant from which the following material was secured, had previously been, and in fact still is, largely engaged in general construction work; but the need of munitions was so urgent that the firm decided to equip a portion of its plant for the purpose of aiding in the good cause. The result of the initial undertaking proved so success-

TYPICAL PLANT LAYOUT FOR THE PRODUCTION OF 4.5 IN., 5 IN. AND 6 IN. HIGH EXPLOSIVE SHELLS.

ful that the entire plant is now equipped for the manufacture of high explosive shells. A brief description of the sequence of production operations on the 6 inch shells is here given.

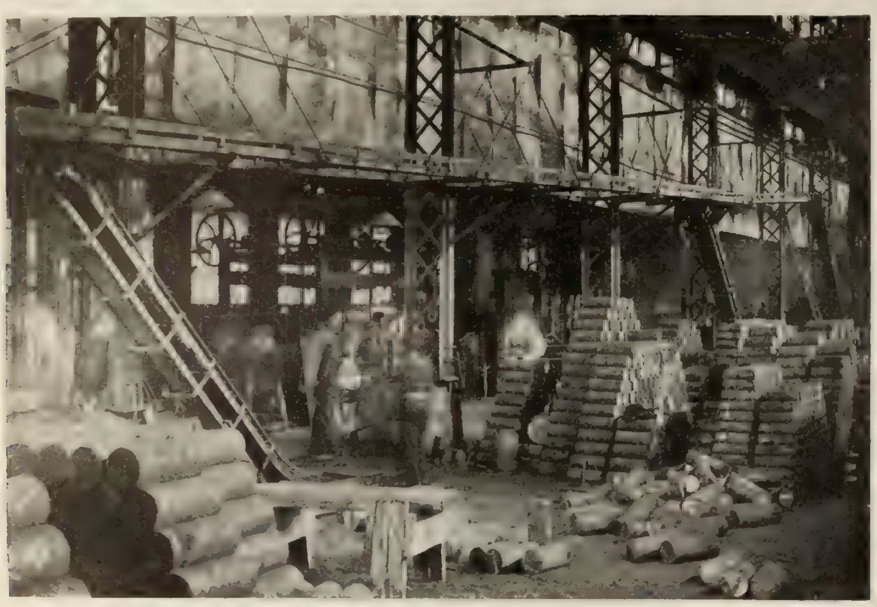

FIG. 1. MATHEWS GRAVITY CARRIER AT LEFT FOREGROUND WITH HEATING FURNACES AND FORGING PRESSES IN REAR.

Receiving the Billets

Two methods of producing the rough billets are now being used; that of casting an ingot in a metal mould, and the other of rolling a bar to the desired dimensions from a forged ingot. In the case of the former, sufficient molten metal is used in each ingot to insure a good sound billet after the crop end has been removed, which in the majority of cases amounts to about 20 per cent. of the total length of the cast ingot. When using stock from the forged bar, the rough portion at the end of the bar is first cut off, and then the billets of a length suitable for the shell forging.

This plant, not being equipped with the necessary facilities for producing the rough billets, receives them from outside sources, and is using stock derived from both the above processes. The billets arrive by teams and also by rail, being stored in separate piles, in relation to their respective heat numbers. To meet the requirements of the Munitions Board specifications, and at the same time maintain a high quality of product, it is essential that every furnace heat be kept separate, as it progresses through the various operations, to the finished shell. Owing to the experience of the past two years, and the increased facilities of production, the losses due to the variation in the physical properties of the different heats, have been greatly reduced. As every shell is stamped, indicating the heat and carbon content, the heating for the forging operation can be so adjusted that the nature of the steel in the finished shell forging will more closely conform to the desired specifications.

Heating and Forging the Shells

The forging department of this plant is equipped with all the necessary furnaces, presses and auxiliary machinery for the production of 4.5 and 6 inch high explosive shells. Two single and two double chamber Mechanical Engineering Co., furnaces are used for heating the smaller billets; while two continuous furnaces of the same make are used for the 6 inch billets. The approximate time required to heat the 4.5 in. billets to the desired temperature of about 2,300 degrees F., is roughly one hour, and to heat the 6 inch billets to a corresponding temperature requires nearly 1¾ hours. The crude oil used for heating the furnace, is under a pressure of 30 pounds per square inch, and is mixed with air at a pressure of 8 ounces.

When the billets have attained the desired heat, they are removed from the fire chamber by means of a long pair of tongs, which are supported by a chain hanging from a rail above the front of the furnace. This rail is arranged so that the shell in its passage to the press passes over a steel plate upon which the billet is dropped; this allows of the scale being removed from the surface before the piece is placed in the die The removal of this scale is an important factor in the making of a good shell forging, as the adherence of scale, especially in uneven patches not only injures the dies, but prevents the steel from drawing uniformly when the punch is being forced into the metal, often resulting in a forging with eccentric walls. When the billet is dropped on to the plate, an operator quickly removes the hard scale with suitable scrapers; and while every particle is not taken off, care is usually exercised to have the surface as clean as possible.

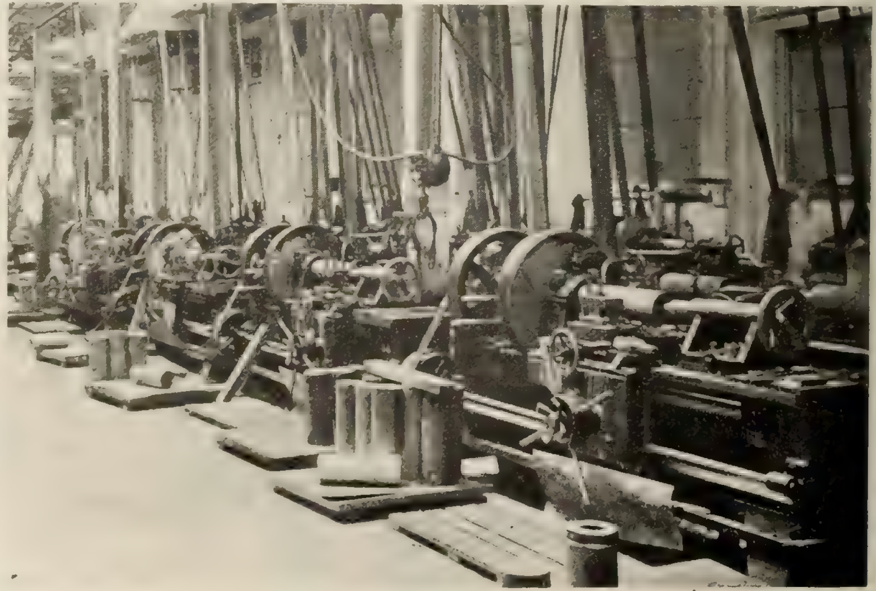

FIG. 2. JOHNSTON & JENNINGS SPECIAL PURPOSE LATHES FOR ROUGH TURNING 6 IN. SHELLS.

Very little time is taken in this operation. The billet is next picked up by another workman with a pair of tongs and dropped into the die, which is made of vanadium steel, as are also the piercing punches. Before the forging of each shell, the punches and dies are cooled by means of running water, and all scale is blown from the die chamber by a blast of compressed air. The die is lubricated between each operation by swabbing the interior with a mixture of oil and graphite; and after the billet is placed in the die, a small quantity of coal dust is thrown on the upper surface before the punch descends. This not only lubricates the punch while the shell is being drawn, but the gas generated at the nose of the punch aids in its removal after the drawing operation is completed. If, however, the shell shows any tendency to cling to the punch when the ram ascends, provision is made whereby a block can be inserted in a suitable slide at the top of the die holder and the shell stripped from the punch.

Three 350-ton hydraulic presses, built by the Southwark Foundry & Machine Co., are operating continuously on the 6-inch shells, each with an approximate capacity of 30 to 35 an hour. These presses receive their power from two Southwark accumulators, one having a piston 24 inches in diameter and a stroke of 12 feet, with 315 tons of iron ore ballast, and the other a piston of 15 inches diameter, a stroke of 15 feet, loaded with 120 tons of iron ore. The accumulators are supplied by two Deans of Holyoke, and one Dean of Indianapolis hydraulic pumps. The two former are belt-driven, one from a 200 h.p. Allis Chalmers-Bullock Co. motor, and the other from a 200 h.p. Canadian General Electric Co. motor. The Dean pump is direct coupled to a 200 h.p. Triumph motor.

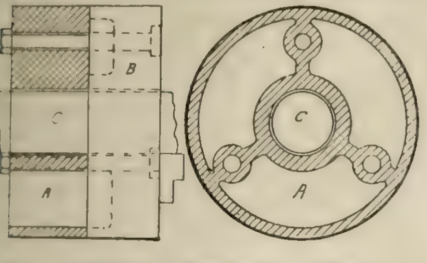

FIG. 4. CHUCK EXTENSION PIECE ON BULLARD SINGLE PURPOSE LATHE FOR INSIDE BORE MACHINING.

After the shells have been forged, they are removed from the die and placed upon a Mathews gravity carrier and transferred to another department. An idea of this installation can be gathered from Fig. 1, which shows the gravity carrier in the foreground and the furnaces in the rear. The elevating portion of this conveying system is mechanically operated by means of a one h.p. motor, located on the structural steel column above the conveyor. When the shell reaches the top of the incline, it drops on to the rollers, and is subsequently transferred to any desired location in the same or an adjacent department.

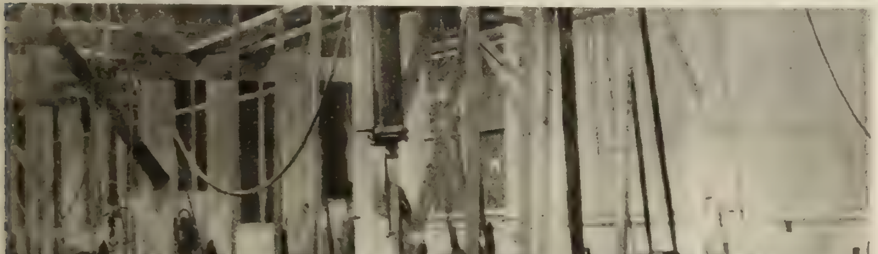

FIG. 3. CINCINNATI PULLEY LATHES ROUGH TURNING 6 IN. SHELLS.

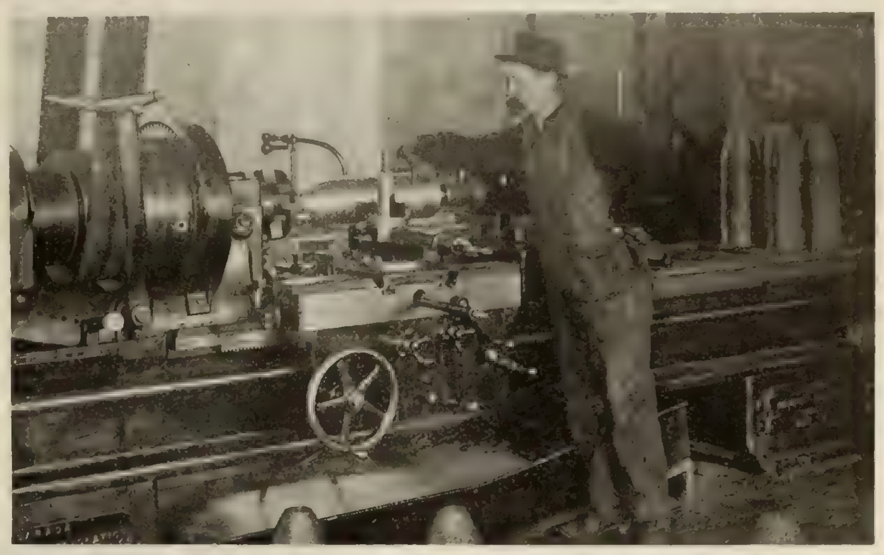

FIG. 5. BORING AND THREADING NOSE, AND FINISH TURNING 6 IN. SHELL BODY.

Machining the Shells

Before the machining of the shells is proceeded with, the rough forgings are carefully examined by competent inspectors for visible defects. Every shell is subjected to various gauging operations, such as overall length, base thickness, concentricity of walls, etc., to avoid any defective shells reaching the machining department. When shells are discovered to have eccentric walls, and yet within the passable limits, they are placed to one side and gives an extra rough boring operation before being rough turned. Experience, however, has almost eliminated this feature, and, with few exceptions, the forgings produced in this plant can be successfully machined without much loss from the forging process.

Cutting to Length and Rough Turning

To prepare the shells for the actual machine operations, it is first necessary to cut the surplus metal from either end of the rough forging. To avoid any unnecessary work on the interior of the shell, the preliminary gauging for the roughing operations is always made from the inside surfaces. When the open end has been cut to length, the base is roughed off, both these operations being accomplished in a number of Hall cutting-off machines. The centre in the base is also located in relation to the rough interior of the forging. This is advisable, for economic production, as it is much easier to remove the uneven metal from the outside surface of the shell. When the cut is irregular during the boring operation, much additional wear and tear is placed upon both the tools and containing turret or operating mechanism. Several engine lathes fitted with three-point expanding arbors are used for centering the base of the shells. Two methods of producing the 6-inch shells are being employed in this plant—that of the steel nose piece (screwed in), and also the solid closed-in nose; the first being gradually superseded by the latter, however. The former method is adopted

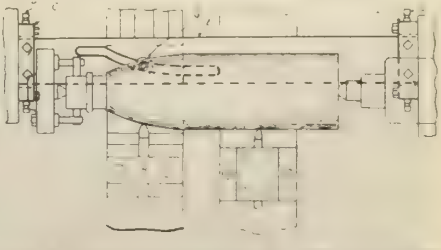

FIG. 6. PROFILE FORMING ATTACHMENT.

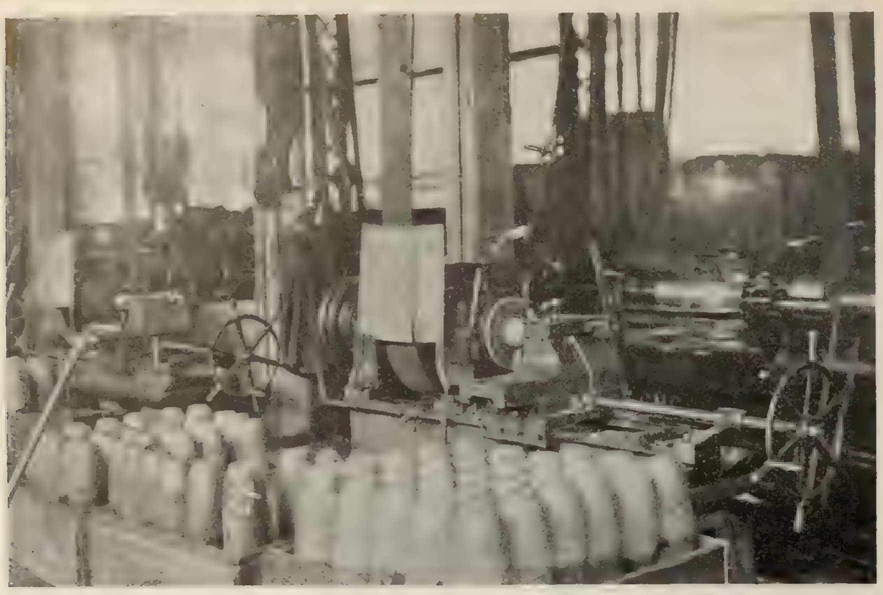

FIG. 7. LYALL LATHES INSIDE PROFILING 6 IN. SHELLS.

when shells are found to be too short for the hot nosing process.

Several makes of lathes, including Wickes, McDougall, Johnston & Jennings, Canadian Fairbanks-Morse, etc., are working on the rough turning operation, the mean average output being approximately six shells per hour on the short shells, and slightly less on the hot nosed shells. In Fig. 2 is shown a row of Johnston & Jennings special purpose lathes at work on the rough turning operation. It will be noticed that small air hoists are provided to facilitate the handling of the shells to and from the lathe. One of these hoists is supplied to every two lathes, a rail running the length of the two machines. Fig. 3 shows a group of Cincinnati pulley lathes on the roughing operation. These machines are fitted with three cutting tools, each mounted on a separate carriage, so that two can be operating on the outside diameter while the third is used for facing off the base. The duty required is, however, so great that the production is no larger than that of the single tool machine, as the feeds must necessarily be reduced; the only advantage is that the base can be faced off at the same setting.

Boring and Nosing the Shell

With the solid nose, the boring operation is somewhat longer, but the necessity of the thread for the other method (that of the removable socket) is eliminated. The cycle of operations when boring are similar to those of the smaller shells; that is, roughing the bore and mouth of shell, roughing out base contour and finishing open end, finishing bore and base profile. Upwards of thirty Bullard single purpose lathes are at work on this operation. These machines are all fitted with chuck extensions, similar to that shown in Fig. 4. These pieces are cored out, as shown, to eliminate weight and yet provide a good rigid support for the shell, when the tools are in operation.

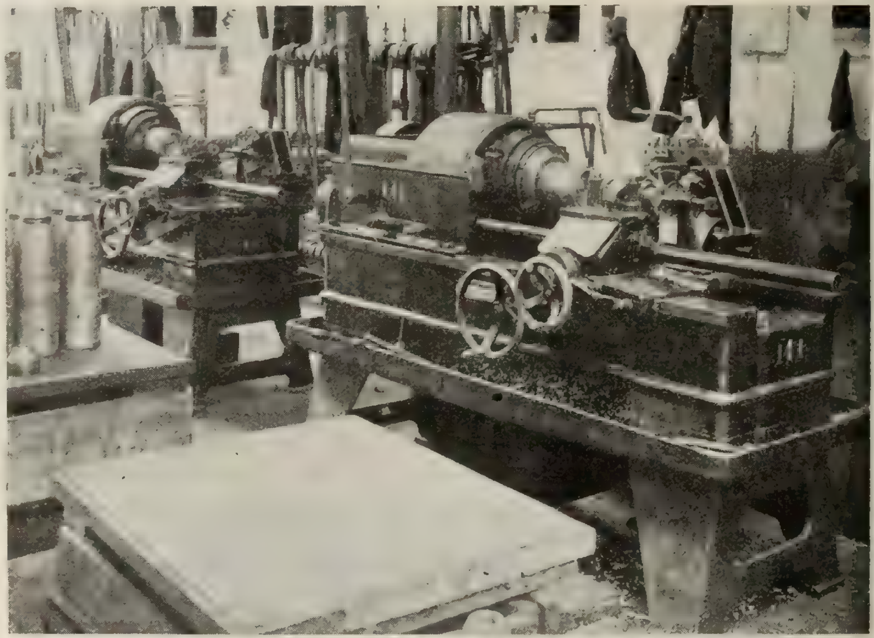

FIG. 8. GROOVING AND WAVING 6 IN. SHELLS.

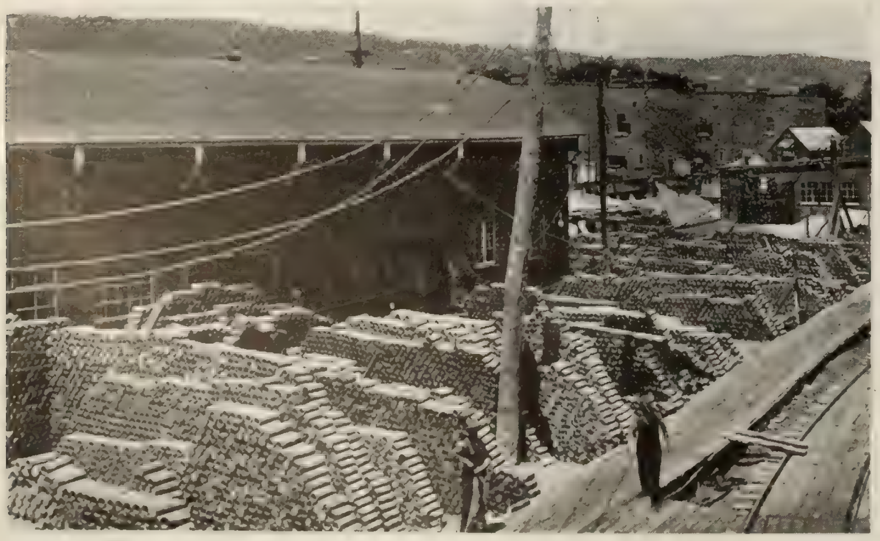

FIG. 10. SHELL FORGING STORAGE YARD.

The shells are now ready for hot nosing. Four Mechanical Engineering Co. nosing furnaces are provided for heating the mouth of the shell, this being inserted into the holes in the front of the furnace and exposed to the heat for a distance of between three and four inches. The temperature required is about 1,700 degrees F., and should be as uniform as possible to give the best results and to avoid undue wear upon the nosing die. It may be interesting to note that the water cooled chamber, through which the shells are placed, is made from two pieces of channel iron, the holes being cut and the entire jacket constructed by the oxy-acetylene process. This has been found to be a great improvement over the cast iron water jacket previously used. Four Perrin presses are being operated on the nosing process. Proper heating is the chief factor in the nosing operation, and, to maintain the highest degree of efficiency, it is necessary to have a reliable man on the furnace, as an inexperienced operator may be the cause of an extra high percentage of rejected shells. If the shell is heated too far down, there is a possibility that the body of the shell below the profile will be distorted, often resulting in a short shell. On the other hand, too low a heat will cause excessive pressure to come upon the die, which may crack or break the latter.

Bore Nose and Finish Turn

After the shells are nosed, they are inspected for overall length and mouth opening. They next commence to receive the finished machine work. Each shell is placed in a special chuck for operations on the inside of the nose, that is, boring to a diameter of 1.9 inches, cutting a small recess 1.2 inches from the face of the shell, reaming and facing, tapping with a 14 thread Murchy collapsible tap, and finishing the face of the nose. The threaded portion is then sized with a hand tap. A driving plug is afterwards screwed into the nose, and the shell placed between the centers of an engine lathe, preparatory to finishing the outside diameter and nose profile. A view of this operation is shown in Fig. 5. The device used to obtain the desired contour of the nose is shown in Fig. 6. The cam plate is secured between the headstock and the tailstock, and provision is made for slight adjustment in the containing brackets C and D. The cam rolled is secured to the cross slide of the carriage, the tool being set in the desired position to form the proper shape of the nose. An auxiliary tool slide is fitted to the carriage for the purpose of turning the parallel portion of the shell. This extra head is, however, not always used; the single tool being often used to accomplish the entire operation, the roller entering the cam slot at the desired location.

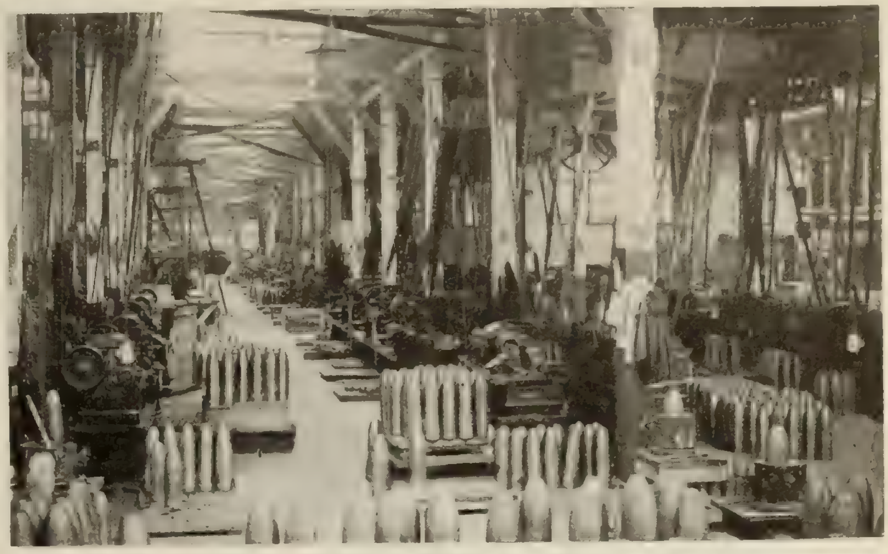

FIG. 11. GENERAL VIEW IN SHELL MACHINING DEPARTMENT.

Inside Profile and Base Recess

A number of Yeates, and Lyall special lathes are at work forming the inside nose profile, the latter being equipped with pneumatic chucks for holding the work. A view of one of the Lyall lathes is shown in Fig. 7, operating on the inside of the nose. Before proceeding with further machining, the shells are weighed to determine the amount of metal to be removed from the base to bring them to the required weight, which at this point should be 88.8 pounds, with a high or low limit of 8 ounces. The stock removal is about 1-64 of an inch for each two ounces. After the shells are faced to weight, they are taken to a number of Bullard lathes to have the base recessed out. With very few exceptions, the base

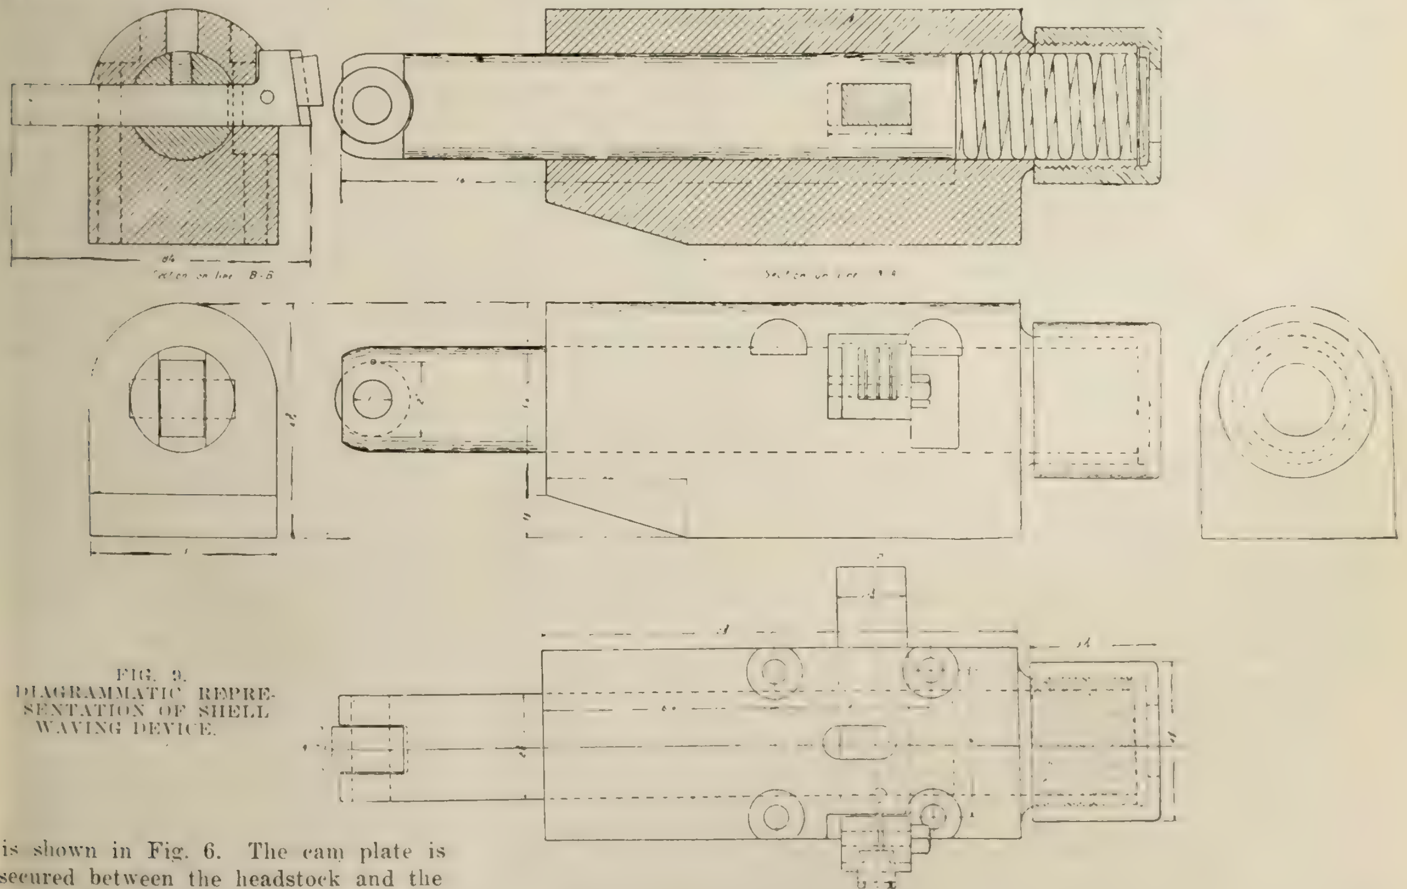

FIG. 9. DIAGRAMMATIC REPRESENTATION OF SHELL WAVING DEVICE.

plates are now inserted in and riveted without recourse to the threading process. The recess for the base plate has a diameter of 4.5 inches and a depth of 0.5 inch, the outer edge of the disc being slightly chamfered, to allow the metal around the edge of the recess to close over it when being riveted in.

Grooving and Waving

The grooving and waving is performed in manner similar to that on the smaller shells. The groove is first roughed-out to the desired depth, leaving ridges of sufficient width to obtain the ribs and form the proper wave which in every case is irregular to prevent any possible slip of the copper band. After the ribs have been formed, the sides are undercut, with a special attachment secured to the tool post of the carriage. Several chisel cuts are afterwards made across the ribs to allow the free escape of the air, when the bands are being pressed on.

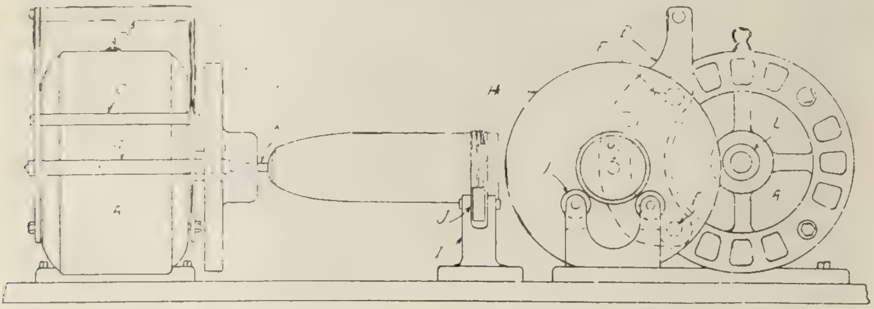

FIG. 12. DETAIL OF SHELL PAINTING DEVICE.

The grub screw hole, for the brass socket is next drilled and tapped, after which the shells are sand-blasted to thoroughly clean the interior of the bore so that the varnish will form an even coating on the interior walls.

Finishing Base Plates and Copper Bands

Following a preliminary inspection, the base plates are put in and riveted, after which the square tips are sawn off by several Racine saws. The base is then faced off, and the shells taken to the varnishing room to receive a coat of varnish on the inside surface. It is very important that this coating should cover the entire surface and be evenly distributed, as the action of the explosive (which is placed therein) has a very deteriorating effect upon any exposed metal.

The copper bands, which have previously been prepared, are now forced over the base of the shell, to a position over the groove. The shell is then placed in a hydraulic press and the band pressed into the groove under a pressure of about 1,500 pounds per square inch. Several Jenckes band turning lathes fitted with air chucks are operating on the finishing of the copper bands.

After the shells are marked, they are given their final shop and Government inspection. The latter is very thorough, and every shell is subjected to careful examination. When faults are discovered, they are rectified wherever possible, so that rejected shells are kept as low in number as possible. The painting of the shells is accomplished by means of the device shown in Fig. 12. The small motor operates continually, the shell being placed in position and revolved by pressing the framework forward, thus bringing the disc H in contact with the small driving wheel L, attached to the spindle of the motor. After the paint has thoroughly dried, the shells are again inspected. Crating in readiness for shipment follows.

* * *

HANDICAP OF BAD BELTING

HOW many machinery users possess even an elementary knowledge of belting? Comparatively few, says a writer in Page's Weekly, yet belting in many cases serves as the great muscle of the workshop for extended power, and if the leather is wrongly fitted, as it often is, and badly-made as some specimens undoubtedly are, the belting capacity cannot be equal to specifications. Many a workshop is losing power and cash daily through its belting.

Leather Belting Characteristics

Putting aside woven belting, which has characteristics of its own, let us see how leather operates. The tenacity of good new belt leather varies from 3,000 lb. to 5,000 lb. per square inch of sectional area, and thickness averages ¼ in. Clearly, if the tenacity "varies," a danger point exists somewhere when two leathers of different tannages are joined in one belt, although that danger may be well beyond the usual stress limit. Those two leathers may have inherent differences, as well as the differences imparted by separate tannages and separate modes of finish, so that to specify one stress limit in pounds for two different leathers may prove misleading. The maker of the machinery concerns himself with power, speed and pulley dimensions, and the user is concerned very materially in the strength per inch of width, and if tensile strength in pounds per inch of width were added, it is argued that the user would have a better safeguard.

Our view is that while a percentage of difference exists between one piece of leather and another, the user may rest satisfied that if he purchases from a reputable maker, in accordance with clear and practical specifications, he may count on obtaining a sound article at a fair price. "Cheap" belting should be classed with other "cheap" goods. Assuming that the right belt is purchased, the fitting should receive the greatest care. Any leather will stretch after a period of use, and if the stretching is excessive then troubles ensue. The removal of undue stretching is as important in its way as the original purchase, for erroneous removal has a sequel in hampered work. A thick belt stretches more on the outside than a thinner one because such a belt cannot lie so closely around the pulley. The greater thickness of material requires greater bending force, and greater friction is set up.

Belt Thickness

Uniform thickness throughout is desirable in all cases, and its influence is particularly emphasised with regard to light high-speed machinery. The cumulative importance of this is illustrated by comparing the velocity of belts on ordinary shop line shafts (1,000 to 1,500 ft. per minute) with the speed of lathe belts, which ranges from 1,500 to 3,000 ft. per minute. The item of centrifugal force has no material bearing upon the line shafts at ordinary velocities, but when the speed reaches 3,000 ft., or more, the centrifugal force tends to reduce the amount of power which a belt is capable of transmitting. Recently, we have heard of belt speeds above 5,000 ft. per minute, due to pressure of work, but such speeds should be discouraged.

Camel-hair belting constitutes a subject which should be dealt with in a separate article. Woven belting exhibits great strength and flexibility, regardless of temperature, water, steam, chemical fumes, etc., yet it is never likely to displace leather in the estimation of a host of engineers. Link belts are useless at high velocities, although they are superior to leather belts at low speeds. In a number of instances compound belts formed by placing one belt upon another have been found to add most substantially to the power transmitted.

Some really useful substitutes for leather belts are on the market, and cotton may have a greater future on the pulley than it enjoys at present. Considering that the fibre is tested to 1,500 lb. per square inch, a belt of such material is capable of great service in the workshops.

PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

MACHINE SHOP ADAPTATION TO LABOR SHORTAGE

By D. A. Hampson

DURING the past two years, the supply of skilled men in the mechanical trades has been woefully short of the demand—the chances of "picking up" a few first-class machinists being about as slim as those of finding grand opera tenors. Three courses have been open to shop managers, i.e., to train new men, to instal automatic machinery and appliances, and to conserve the energies of their employees so as to secure the greatest possible production. To this end, a shop of 35 men doing a general machine business and small accurate manufacturing adopted some methods as follows:

A beginning was made with the receiving and shipping end. As the plant was away from the railroad, all raw and finished materials had to be trucked. Raw material came in as tubes and pipes, rolled stock boxed and unboxed, barrels of castings and forgings weighing up to 500 lbs. The finished product went out in heavy boxes and barrels, also in crates, weighing up to 2,000 lbs. All the foregoing came and went through a ground level door at one end of the building. The factory building stood in a large space of fairly level ground and was 150 feet square. Owing to the diversity of products, different classes of work were done in different parts of the building, the tools being arranged to suit. The castings, forgings, and bar stock went largely to separate departments. This much description is necessary to give a clear idea of conditions—which it will be noted are not unlike those found in many shops. Truck men delivered goods to the shop floor and loaded from there. To transfer the heavy barrels and (generally) 20 ft. bar stock, shop help was employed.

Improving Shipping Facilities

While this item of transferring had at one time been considered, it was not a dead loss, for it was added to selling price—the customer willingly paying, because the products were mostly patented and were labor-saving supplies of merit. When there came a shortage of men, however, the matter became too big to overlook. The discomfort of having large doors open in winter, the time Jim's miller was idle while he was giving a hand with the barrels, the time of three men who had to stand aside while the long boxes were shunted around past the inspection bench, and that of the two or three laborers who were always required anyway, had finally to be considered. As the time loss figured up as high as 30 hours per week, there was little hesitation about putting some betterment into practice.

A drive was graded part way around the building so that a wagon body was on the floor level at certain points and above it at others. A loading platform with storm doors was built, and receiving doors and hatches were cut for the different departments: the object was to put the entire transfering on the truckman. The barrels were rolled down a slight incline to the very spot where the forgings were first used, long pipes and boxes slid out of the wagon through the hatches on permanent rollers to a position directly in front of the storage racks, machines were rolled out directly into the wagons—there was no lifting for the truckmen, and his work was easier, besides there was nothing for the shop men to do.

Elimination and Simplification

Inside the shop, many of the merely physical operations that machinists were doing were given to boys or laborers, or eliminated altogether. Several more drinking fountains were installed and toilets put in — this saved the time it took to walk often 250 feet several times a day. It had been customary for the men using machine oil, cutting oil, or compounds to fill their own squirt cans and the pots on the machines. This work was given to a boy whose duty it was to make four daily rounds and replenish the supply. The same boy gathered up tools that were out of place and returned them, carried lathe and planer tools to the blacksmith, and other similar work. Once a week, the boy doled out the supply of waste.

Because of the interruption and loss of time therefrom, sweeping in the daytime was abandoned, and was done at night along with cleaning out of the chip pans. The night man was instructed in the repairing of belts and did all of this work except breakdowns, which were rare after the machine hands got the habit of watching out for and reporting loosened laps and frayed laces.

Racks were built near the drills, the arbor press, and on walls, and tools like taps and dies, reamers, arbors, drills, wrenches, etc., in common use were taken out of the tool room and put in the racks most convenient to the place where used. While this did not improve the general appearance of the room, it saved a great deal of time spent in running to the tool room, waiting, checking, etc. The loss from this method (which might seem like retrograding) was no more than under the old system and the gain was great.

Quite a saving of machinists' time was effected by training a couple of bright helpers in the rudiments of setting up work. If, for instance, a pulley was to be bored, a helper changed the faceplate for a chuck, got out bolts and clamps, and roughly trued up the piece, turning the job over to the machinist who did the accurate centering and borrowing. The helper put the tools away when the job was done. By so going around ahead, the helpers gave the machinist a chance to do a maximum of skilled work. Some work like rough planing, roughing cuts on heavier castings, and practically all of the drilling was turned over to helpers altogether. These arrangements were mutually agreeable—the machinists being glad to be relieved of the hard physical labor, and having in consequence more energy for the closer work. The helpers were glad to learn and to be put in the way of advancement. In connection with general machine work, an important point was observed and saved a good bit of time. All castings on receipt from the foundry were marked on the finished surfaces and then the helpers went over them looking for lumps, scabs, sand on the faces, and particularly in corners wherever cutting had to be done. These places were well cleaned and prevented many a broken off and spoiled tool.

Wholesale Labor Saving

On the sensitive drills it had been the practice to use squirt cans with cutting compound, and to clean jigs with brushes. A pipe service was put in that did away with the cans and brushes by supplying a flood of liquid, and most of the jigs were fastened down. In some cases more than half of a man's time was saved. Drills in sufficient quantity were supplied and kept sharp by a boy so there was little delay there.

Realizing that the secret of rapid assembling is in accurate machine work, better and more gauges were made, parts were completely jigged, and more inspections were made. Savings of from ten to two hundred per cent. were thus made. Simple devices for doing away with the use of hammers, hand punches, pliers, etc.—tools which have to be picked up and laid down, were perfected.

In the milling machine operations, pronounced savings were effected. This work was all on Lincolns and semi-automatic millers and the cuts were short necessitating a man for each machine or each two of the latter. The feed screws in some machines were lengthened out to suit the new fixtures made. These fixtures, as far as possible, held long rows of parts and while they were cutting, the operator could load up two others.

One battery of six machines that had been run by three men was so arranged that two men were no longer needed, and were given other work. Compressed air fixtures were applied for clamping the work and the air valve was operated by a dog on the table, so that the operator had only to "click" the feed on and later return to find the work milled, the table returned, and the work loosened up. To facilitate his getting about and forestall fatigue, his seat was set on rollers running on a track before the row of machines and then after loading up his six machines, he could give a shove and bring himself back to the starting point with a rush.

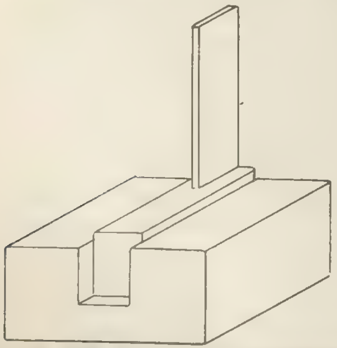
The shortage of men thus started what proved to be an efficiency campaign. No part of the plant escaped. In the drafting room, fewer tracing and blueprints were made of parts that would not be wanted again. Boys and helpers moved the tote boxes around where skilled men had done it before. Packing boxes were standardized and made in quantities. Whenever possible, the final inspector placed his parts directly in the shipping cartons or boxes. These changes secured a greatly increased production and the loss of some employees was not so keenly felt as it would otherwise have been.

⁂

TRY-SQUARE HOLDER

By C. H.

IT is a difficult matter to keep a tool such as a square on a machine without knocking it over, or having it fall on the floor. Especially is this true when using one to square up work being ground on a disk-grinder, where the vibration of the machine jars it off the table. A square is an expensive tool and requires care in order that it will not become nicked, or out of true. A useful suggestion is shown herewith of a try-square holder. It is simply a block of wood having a groove cut across the face wide enough for the heel of the square to fit into. The block will always keep the square upright on a machine or wherever it is used.



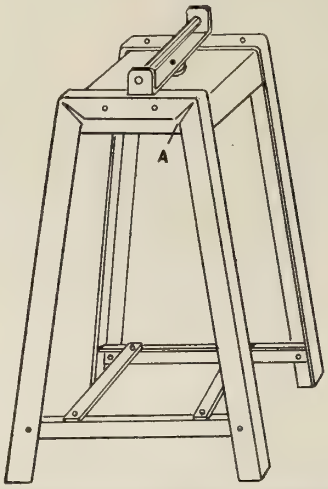
BLOCK FOR HOLDING TRY SQUARE.

⁂

HACK-SAW MACHINE STOCK SUPPORT.

By J. E. C.

WHEN cutting off pieces from long bar stock in a hack saw machine, it is necessary to support one end of the stock in order to hold it straight and keep it from tipping up in the vise; also, so it can be easily moved along after a piece is cut off. In the accompanying sketch is shown a cheaply contrived stock-stand that can be produced from 1 in. angle-iron. Two pieces indicated at A, are cut out where the bend is made in the legs and cross-stays are riveted on the lower part of the legs to keep them from 2 in. thick by 6 in. square. In the center of the block, fastened with a bolt and washers, is a cast-iron bridge containing a steel roller on which the stock is supported. A rod extends through the roller as shown. The height of the stand should be directly on a line with the seat of the vise. The apparatus is light and rigid, and is easily moved about.



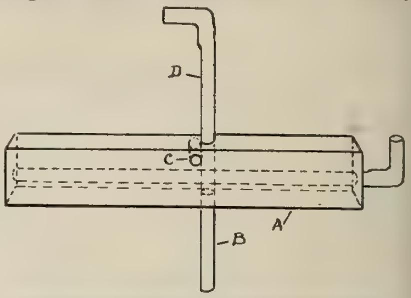
SUPPORT FOR STOCK IN HACK SAW

⁂

A NOVEL DEPTH-GAUGE

By Alden Street

THE depth-gauge shown in the accompanying art for measuring depths of holes, tee-slots, etc., is designed on a simpler principle than the most of those in general use. The block A consists of a piece of square cold rolled stock, having a depth-finder or rod B. Instead of the usual screw for holding the rod in place, a small pin C is driven in the block A, passing slightly through the rod hole as shown. The rod B is filed or slightly flattened off along the side as at D, so that it will have a free-fit in the hole. To locate a depth, the rod B is simply pushed down, and then given a slight turn which binds it firmly against the pin C. A hole is drilled through the center of the block for holding the depth-finder so that it may be laid flat in the tool-chest.



SIMPLE FORM OF DEPTH GAUGE.

⁂

WEIGHT CHART FOR CYLINDRICAL STEEL STRUCTURES

By Woodworker

IN the August 17 issue of Canadian Machinery a chart appeared under the title, "Chart for Finding Weight of Cast Iron Pipe." Here is a similar chart, except that it applies to cylindrical steel structures. Its range, as will be noted, is very wide. The length (or height) of the structure may be 100 ft., diameter 100 ft., and thickness of steel may be anything from 0.1 inch to one inch.

For example, how many tons of steel would be needed to build the cylindrical shell of a water tank 20 ft. long, by 10 ft. diameter, steel being 0.5 inch thick? Connect the 20 (column A), and the 10 (column E), and locate the intersection with column B. From the intersection, drop over to the 0.5 (column D), the intersection there with column C gives the answer—about 5.7 tons. The basis of the chart is 2240 pounds per ton.

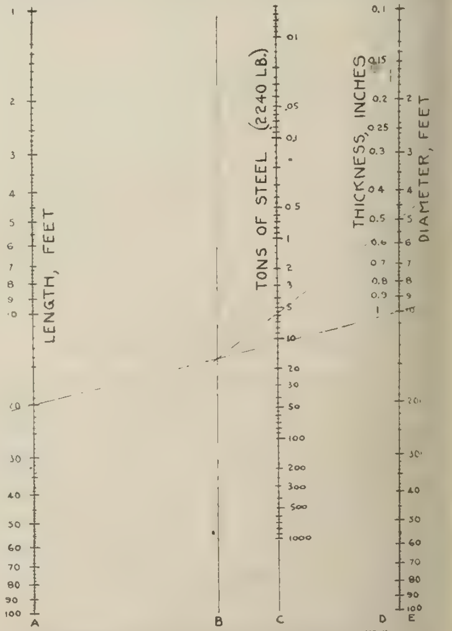


CHART FOR FINDING WEIGHTS.

Engineering Exhibits at The Canadian National Exhibition

Staff Article

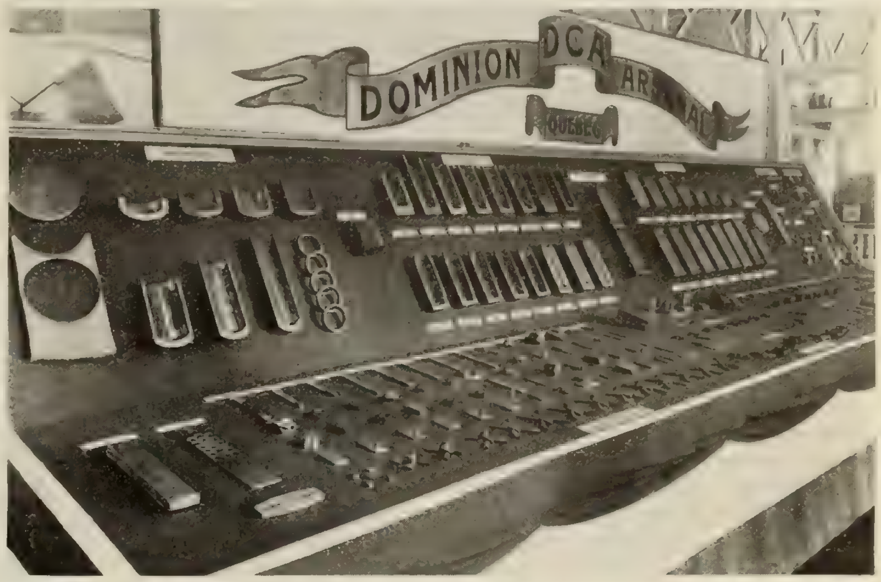
Some of the products on view in the Machinery Hall still bear evidence of war-time influence, but at the same time the trend of future events is witnessed by a general advance in quality, design and application indicative of a national determination to still further enhance the reputation already earned by so many of our Canadian manufacturers.

EACH succeeding year since the outbreak of the war has witnessed the increasing importance of the engineering industry as one of the deciding factors. The co-operation of the Imperial Munitions Board with the authorities of the Canadian National Exhibition has resulted in a unique display of war products by the leading munitions firms of the country.

Housed in what was formerly the education building, these exhibits possess a double attraction for the discriminating observer: not alone because of the destruction which marks the termination of their existence as manufactured products, but also because of their significance as evidence of the ability and versatility of our manufacturing firms. From motor cars to fuses, from bridges to cartridge cases, from bricks to steel shells, no transfer of effort has been too great to prevent complete success, and as if such incidents were not convincing enough, there is the case of the steel companies who had to produce a new type of steel and at least one concern which is producing copper bands from the raw metal.

Steel Making

Prominent amongst the large exhibits is that of the Nova Scotia Steel & Coal Co., which consists of samples of the various substances which enter into the composition of shell steel. Coal, coke, iron ore, lime stone, magnesite, etc., are all shown in the natural state just as the steel maker uses them. The gradual transformation of these materials into a real live 9.2 in. shell is illustrated by specimens of pig iron, a full size ingot of shell steel weighing 6670 lbs., standing eight feet high, and various sizes of bars into which the ingot is rolled and from which the different shells from 18 pdr. to 9.2 in. are forged. The exhibit is in the charge of M. P. Graham who displays pardonable pride in its completeness.



DISPLAY BY DOMINION ARSENAL, SHOWING SMALL ARMS AMMUNITION, SHRAPNEL AND BANDS.

Fuse and Cartridge Making

As if in contrast to the massiveness and weight which characterizes the exhibit referred to above, the displays of the Dominion Arsenal, Quebec, and the Russell Motor Car Co., Toronto show products of the machine shop which vie with each other for accuracy and complexity of manufacture, smallness of component parts, and rigidity of specifications to be met. The former display illustrates the making of small arms ammunition i.e. cartridges cases, bullets, clips, etc., with samples of the punches, dies, traps, gauges and other small tools used in their production, the raw material being shown in successive stages as each operation is completed. Brass cases and copper driving bands for 18 pdr. shells are also exhibited from the copper

ingot and brass disc through the successive operations.

The various stages of fuse manufacture are shown in a similarly complete manner by the Russell Co. Parts in profusion enter into the construction of these important articles, the extreme accuracy combined with oddness of shape or smallness of size rendering their successful manufacture an accomplishment of no mean order.

EXHIBIT OF IRON AND WOOD-WORKING MACHINE TOOLS BY THE CANADA MACHINERY CORPORATION.

British and Russian Shells

The Dominion Bridge Co., along with Montreal Ammunition Co., and Dominion Copper Products Co., shows sectional specimens of each operation on 18 pdr., shrapnel and high explosive, 4.5 in. 60 pdr. and 6 in. British, and 75 mm. Russian forgings; while copper bands for all sizes and brass cases for the smaller sizes are likewise fully exhibited. The companies are represented by J. H. Bradley, and their record is displayed on a special poster which shows that over 6,000,000 brass cases alone have been shipped to date with proportionate outputs of other items.

A novel treatment of their stand is shown by the Canadian General Electric Co., and Canadian Allis-Chalmers who display a number of photographic transparencies showing numerous scenes in their various factories where munitions are now being produced. These companies are making a greater variety of munitions than any other firm in Canada, amongst their product being 3 in., 6 in., 7.5 in. and 9.2 in shrapnel for the navy and 18 pdr., both types, 4.5 in. and 60 pdr. for the army, including cartridge cases and percussion primers, numerous samples being displayed in an attractive manner under the direction of J. F MacLean.

Both branches of the armed forces are represented, the navy by an 18 in. Whitehead torpedo and the army by a captured German field gun. The torpedo is ably explained by Lieutenant Miller of H.M.C. Torpedo Depot, the exhibit being loaned by the Dept. of Naval Service, Halifax. Compressed air is supplied to the apparatus so that the propellors, rudders and all controlling gear may be seen in motion. The field gun was captured by the 9th Lancers in Aug, 1914, when the enemy was within 25 miles of Paris.

The moving picture exhibit is staged in the annex and gives a lucid insight into the actual conditions under which our munition workers are now doing their bit throughout the country.

Other exhibitors include:—Brown's Copper and Brass Rolling Mills; John Bertram & Sons Co.; Brandram-Henderson Ltd.; Canadian Car and Foundry Co.; Canadian Explosives Ltd.; Deloro Mining and Reduction Co.; Empire Mfg. Co.; Ross Rifle Co.; Standard Brick Co.; Standard Chemical Co.; H. Bock; Universal Tool Steel Co.

Machinery Hall

The gathering of machinery builders, dealers, and buyers which takes place in this department retains its hold on the trade as an annual event of importance, having shown a tendency of recent years to becoming somewhat of a counterpart of those conventions of kindred societies which in other countries have become important factors in various industries. The opportunity for renewing old and making new acquaintances is accepted by many while the value of the event as an occasion on which to introduce new designs and models is too well known to require any comment. Armstrong, Whitworth of Canada, have provided a tasteful reception room where the visitor may investigate in ease and comfort the merits of the first high-speed tool steel to be made in Canada. Prominent among machine builders is the Canada Machinery Corporation who have arranged their display in an exceedingly creditable manner. A model of a field gun constructed of ball bearings is a feature of the Chapman Double Ball Bearing Co.'s display, while an emergency outfit of oxy-acetylene cutting apparatus which has already saved many lives in railroad wrecks is a fea-

ture of the Carter Welding Co., exhibit. The Canadian Hoskins Co., are showing a full line of both gas and electric furnaces while the belting industry is represented by Dominion Belting Co., and D. K. McLaren. The A. R. Williams Machinery Co., exhibit an extensive line of machinery including special toy machinery in the process building, and amongst new comers is noted the Thwing Instrument Co., showing pyrometers. Following is a list of exhibitors and representatives.

Armstrong, Whitworth of Canada, Montreal High-speed steel and small tools. Representatives, H. Johnson, J. L. Hynes, Rooms 201 King Edward Hotel.

Armstrong Cork and Insulation Co., Toronto Insulating materials, cork products, models of power plant equipment showing applications, etc.; samples of diatomaceous earth. Representatives, J. C. Kyle, G. C. Albertson, H. Johnson.

Aylmer Pump & Scale Co., Aylmer, Ont.—Hand and power pumps, scale trucks, water supply systems.

Russell Motor Car Co.
GRAZE FUSES

TIME AND GRAZE-FUSE PARTS, COMPLETED FUSES, ETC., ILLUSTRATING WORK BY RUSSELL MOTOR CAR CO.

L'Air Liquid Society, Toronto—Oxy-acetylene welding apparatus, gas generators; work in progress. Representatives, L. B. Deane, A. M. McDougall.

Boiler Repair & Grate Bar Co., Toronto—Gate" firebrick lining for boiler furnaces, 20th Century grate bars. Representatives, C. W. Andrews, A. H. Hetts. Also products of United States Graphite Co., Saginaw, Mich., represented by E. D. Robinson.

Baines & Peckover, Toronto—Exhibit of tool steel, crucible vanadium and cold rolled steel; expanded metal, chain, wire and kindred products. Representatives, C. R. Peckover, W. M. David, J. A. Steven, H. Marshall, H. Febet.

Boico, Ltd., and Shell Bar Grate Co., Toronto Boiler compounds and grates. Representative, Mr. Downes.

Canada Machinery Corporation, Galt, Ont.—[illegible] in. tool room lathe, completely equipped; [illegible] in. by 10 ft. quick-change, double back-geared engine lathe; selected wood-working machines, including hollow chisel and chain mortisers, 12-spindle dove-tailer, etc. Representatives, D. King, P. D. Burton, W. J. Irving, I. Preston.

Cleveland Pneumatic Tool Co., Toronto—Full line of Cleveland apparatus, hammers, drills, grinders, riveters, couplings and accessories. Representatives, C. D. Garner, H. F. Olrich.

Chapman Double Ball Bearing Co., Toronto Transfer trucks, transmission bearings and various ball-bearing appliances. Representatives, W. C. J. Hockin, M. J. Fulcher.

Cling-Surface, Buffalo—Exhibit of special preparation for maintaining efficiency of driving belts. Representatives, J. B. Faatz.

Canadian Ice Machine Co., Toronto—Refrigerating machinery and supplies. Representatives, F. F. Allison, C. Bower, C. E. Allison.

Carter Welding Co., Toronto—Davis-Bournonville oxy-acetylene apparatus, mechanical equipment for cutting, emergency outfits for rescue work; demonstrations in progress. Representatives, P. Sorley, H. W. Carter, C. Steadman.

Cowan & Co., Galt, Ont.—Selected types of modern wood-working machinery. Representatives, W. Cowan, S. F. Barrows, W. C. Clark.

Geo. W. Cole Co., Toronto—Steam specialties, including Cole boiler feeders, heaters, etc. Representative, Geo. W. Cole.

Climax Baler Co., Hamilton—Machine for packing waste paper. Representatives, H. Robinson, Melville Moore.

Canadian Hoskins Co., Walkerville, Ont.—Gas and electric furnaces, pyrometers, etc. Representative, G. F. Shepherd.

Dodge Mfg. Co., Toronto—Dodge wood pulleys, shafting, bearings, hangers, demonstrating line of transmission equipment. Representatives, T. F. Gary, J. F. Haas.

Dominion Belting Co., Hamilton—Stitched belting of all sizes for power transmission and conveyor equipment. Representative, J. Scott.

Day Name Plate Co., Toronto—Representative, L. S. Day.

Elliot Wood Worker, Toronto—Combination wood-working machines, floor sander, etc. Demonstration in progress. Representatives, W. A. Elliot, Frank Elliot.

Foster, W. L., Toronto—"Carbic" system of oxy-acetylene lighting. Representatives, A. E. Haigh, M. V. O'Neill.

Goodyear Tire & Rubber Co., Toronto—Goodyear products. Representatives, W. H. C. Crosby, R. F. Fox, — Wood, F. E. Holland.

Garlock-Walker Machinery Co., Toronto — Giddings & Lewis tool room lathe, Hepburn 6 in. shell lathe, wood-working machinery, including "American" double arbor saw table and Linderman dove-tailer; display of Thor pneumatic tools, and machines in operation. Representatives, W. Garlock, jr., A. B. Walker.

Holden Co., Montreal—Pneumatic and electric portable tools, rock drills, railway supplies, etc. Representative, J. B. Wilson.

Hutchinson Woodworker and Contracting Co., Toronto—Wood-working machinery in operation. Representatives, M. Hutchinson, P. H. Bradley.

Jones & Moore Electric Co., Toronto—Electric motors and machinery in operation.

McLaren, Ltd., D. K., Montreal—Leather and balata belting, wood and pressed steel pulleys, transmission accessories. Representative, W. S. Hamilton.

Massey-Harris Co., Toronto—Gasolene engines in operation, portable saw outfits, farm appliances, etc. Representatives, N. A. McIntosh, E. Greig.

Morrison Co., J. L., Toronto—Bookbinders and paper machinery. Representatives, D. Brown, W. Duncan, C. Leake.

Positive Clutch & Pulley Works, Aurora, Ont.—Power transmission apparatus. Representatives, R. A. Fraser, — Beard, W. Day.

Pratt & Whitney Co., Dundas, Ont.—Samples of fine tools, cutters, gauges, etc. Representatives, M. B. Davidson, H. Webb.

SHELL BOX PRICES—ARE THEY ADEQUATE?

ALTHOUGH we have heard a great deal of discussion recently in regard to the shell box business in Canada, bearing chiefly upon the prices at which contracts have been awarded by the Imperial Munitions Board, we, says The Canada Lumberman and Woodworker, have avoided discussing the subject to any extent, feeling that it was wise to wait until the situation had been developed more fully and the pros and cons of criticism that we have heard had been more definitely sifted out. We have heard so much criticism during the past few weeks, however, that it seems to us that the situation now calls for some publicity. Briefly, the main point of criticism that we have heard from many quarters is to the effect that contracts have been let at such low prices that there is no profit in them for the manufacturers. It may be thought by some that this is an indication of good business on the part of the Government, or rather on the part of the Imperial Munitions Board, but when the matter is analyzed it is not difficult to see that by following out such a course the Munitions Board is really cutting off its nose to spite its face.

We cannot put this matter any more clearly or forcibly than in the words of a manufacturer and wholesaler who discussed the matter with us recently. This man, representing one of the most important Canadian firms, finds that in selling material to the box manufacturers he is up against a very different proposition to any that he has had to face in the past. In spite of the fact that he is dealing with firms that are handling very large orders for the production of shell boxes, he has to be on the watch every minute of the day in connection with the credit end of the business. He is gradually eliminating many of the customers whom he took on at first, finding that it is not safe to give them credit, and that without credit they cannot handle the business.

Production Cost

"In the first place," this lumberman says, in speaking of the Bethlehem box, "there is the question of cost for the production of shell boxes. The cost of labor, the cost of bands, steel, etc., are all very much higher than they were for the old boxes, and the price of lumber should be higher, but we cannot get it. The man who makes a contract for the box, in the first place, cannot cut down his labor cost, and there is a close enough combination among the steel producers to prevent him from cutting down the cost of steel. The only way in which he can keep down the cost is by trafficking around with his order for lumber until he can get it at the lowest possible price. Naturally, the first result of this is a tendency on the part of the firm from whom he buys the lumber to furnish him with an inferior article. The lumberman has to do this in order to get his cost out of the order at all. It costs just as much more proportionately to produce lumber to-day as it does to produce steel.

Disposition of Contracts

"Then there is another feature of the situation that is of great importance. A large portion of the orders given out for shell boxes during the past two months have gone to concerns that are being run by a liquidator, or to concerns whose credit ratings are such that they are not entitled to the regular lumber terms of credit. The consequence is that if you want to sell material to them you either have to stand out for a straight cash discount before you unload the stock or take your chance of ever getting your money for your goods. Labor has no such a thing as a credit term. It must be paid for each week. Steel concerns will not give credit. As a consequence, the box manufacturers pay for their labor and pay the steel man, while the lumber manufacturer and dealer either holds his lumber or takes a considerable risk. If the box manufacturer can make good and work out a profit—which is questioned by most of the authorities upon the subject then the lumberman will be paid; but if the box manufacturer falls down, as it is predicted that many of them will, the lumber dealer and the manufacturer of lumber are stung.

Lumberman's Protection

"The question, then, arises as to what protection the lumberman can get under these circumstances. Will the Government permit him to attach moneys due, or will they throw out an application for attachment, the same as they do when you try to attach the wages of a Government employee; or, provided they permit you to attach these moneys, will they then cancel the manufacturers' contracts for boxes? In the face of the great quantity of orders that have been placed for these boxes and of the fact that so many of the manufacturers are now falling down on their deliveries and dropping out on their contracts, would it not be possible for the Imperial Munitions Board to do something in the way of assisting those who are supplying these materials, so that they may be secure as to their money? The supplies of material are just as necessary to the quick and efficient delivery of munitions and boxes as the work that has to be done in their production, and are just as worthy of consideration from the Munitions Board.

A Constructional Anomaly

"There is another feature in connection with the production of the Bethlehem box that calls for some criticism. In the production of these boxes it is stipulated that the diaphragms are to be produced from one quarter and five-sixteenth inches veneer. This material costs about three times what it would have cost to produce the diaphragms in solid wood, and it is very questionable whether they are any better in veneer. The only material effect that the use of veneers for this work has had, so far as we can see is that practically all of this material, instead of coming from Canadian manufacturers who are paying taxes and bearing the brunt of our financial troubles, is coming from veneer manufacturers in Wisconsin, who, of course, are paying a duty to our Government when the stuff is imported, but are having 99 per cent. of the duty refunded as soon as the boxes are shipped out of Canada. On the whole, is there anything fair or equitable in the manner in which the Imperial Munitions Board are treating the lumbermen of Canada in this shell box situation?"

If the price at which shell boxes are now being ordered by the Munitions Board is not sufficient to permit of the manufacturers doing their business in a sound and moderately profitable basis, the sooner the fact is properly appreciated by the board the better it will be for all concerned. Our definite conviction is that the board should make a detailed study of the cost of production of its shell boxes and make sure that orders given out are upon a price base that will not increase the financial difficulties of manufacturers in Canada to-day.

* * *

TRANSMISSION SAFETY—III.

NUMEROUS accidents occur to men whose duty it is to oil the bearings of overhead shafting. It is highly desirable to prohibit the oiling of shafting while it is in motion, but this is not always practicable, when the bearings are of the usual type. A special form of bearing, known as a "ring bearing", is favored by many shops, and it is to be commended to the attention of those who have not tried it, inasmuch as it greatly lessens the likelihood of accidents from oiling. This form automatically supplies oil to the bearings from a small reservoir which holds a sufficient amount to last for more than a week. The reservoirs throughout the shop can then be filled on Sunday, while the machinery is idle, and in this way the danger from oiling moving shafting is entirely obviated.

When the bearings are of the ordinary type, they can be oiled with a fair degree of safety by doing the work from elevated platforms or walks, properly railed and running parallel with the shafting for its entire length. Provision can often be made for platforms of this kind when designing and laying out a shop, but it is usually a difficult matter to instal them in a shop that was erected without reference to them. Another method that can sometimes be used with advantage consists in erecting, parallel to the shafting, an overhead rail or track, along which an iron ladder travels by means of wheels or rollers. In most cases this plan is difficult of application in shops that are already in use, because the ladder would interfere with belts or pulleys, or with machinery on the floor.

Vertical pipes are sometimes extended through the floor over the shafting and immediately above the bearings, through which oil may be poured; but when this is done it is not easy to see how much oil reaches the bearing, and the attendant is therefore likely to use either too little oil, or else an excess of it. In the former case the bearing may run dry, while in the latter case a considerable quantity of the oil may be wasted. Special oil-cans are sometimes used, having necks or spouts bent in the form of a U at one end,—the necks being long enough to permit the oiler to lubricate the bearing while standing upon the floor.

EXHIBITION NOTES

Over 15,000 men did all or part of their training at the Exhibition Camp last winter.

Over 1,000 persons will take part in the performance daily in front of the grand stand at the Canadian National Exhibition this year.

Exclusive of live stock and outdoor exhibits there is an exhibit space at the Canadian National Exhibition of over 500,000 square feet.

The exhibit in the Fine Arts Gallery this year at the Canadian National Exhibition will comprise 200 masterpieces of French art representing all the schools of the present day.

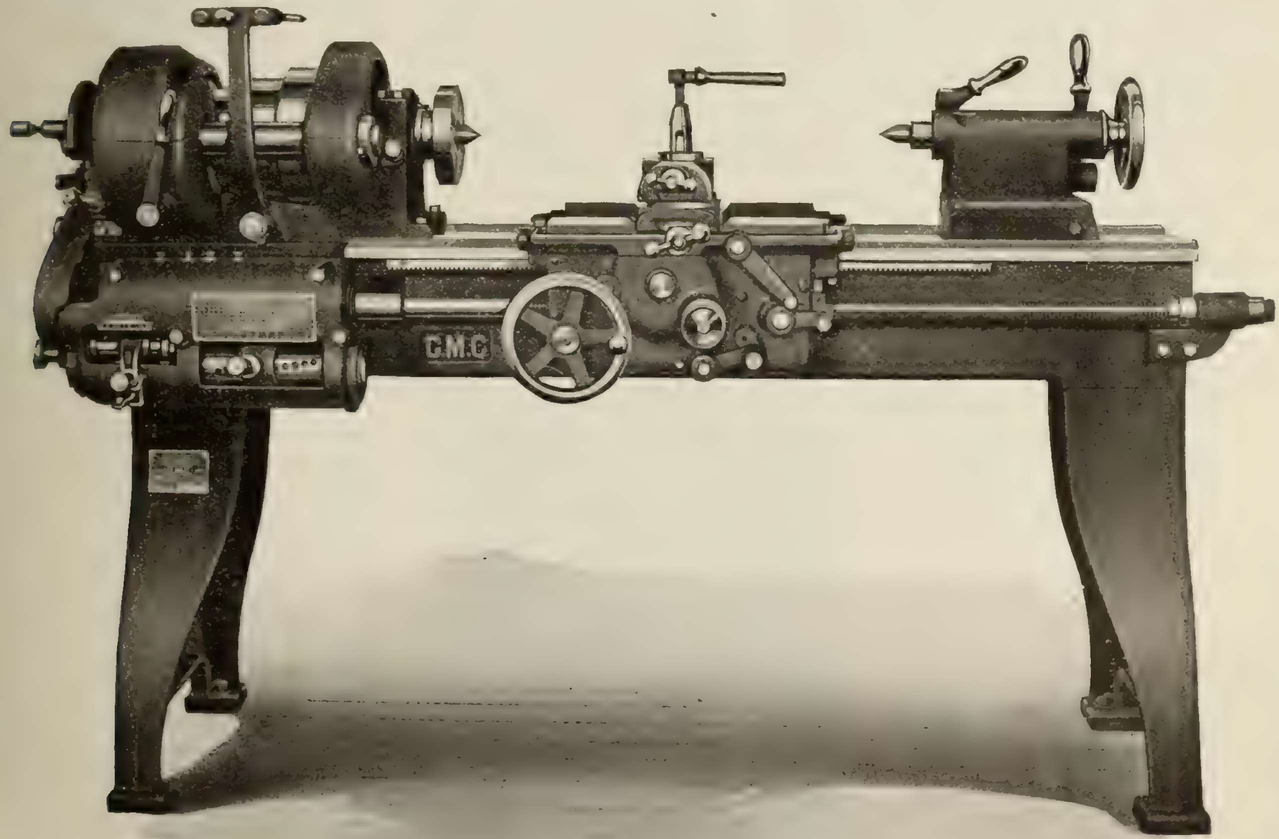
Saturday, Aug. 26th, and Monday, Sept. 11th, are exhibitors' days at the Canadian National Exhibition, and the public are not admitted. On the other twelve days everything is in full swing.

PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

NEW DESIGN 14-INCH QUICK CHANGE ENGINE LATHE

A NEW design, 14-inch quick change engine lathe has been placed on the market by the Canada Machinery Corporation, Galt, Ont., its special purpose being to meet the requirement demand from small machine shops, technical schools, etc., for a tool embodying all up-to-date improvements, with at the same time the widest possible range of service. From the illustration and detail description that follow, it will be observed that the C. M. C. may justly claim to have achieved the ideal to which they aspired. In addition to having a contract to supply a number of these lathes for the machine shop department f the new Technical School, Toronto, ·veral are already installed and operatig in the machine shops of Canadian etal-working plants, the managements which, in every case, we are given to nderstand, express complete satisfacon both with the lathe workmanship id its quality and quantity product



NEW DESIGN 14-IN. QUICK-CHANGE ENGINE LATHE.

We are advised that one of these lathes is included in the C. M. C. exhibit in the Machinery Hall at the Canadian National Exhibition now being held in Toronto.

As indicative of the handiness and adaptability of this lathe, reference may be here made to its thread-cutting provision, the latter admitting a range from 32 threads per inch to 5-inch lead, or one thread in 5 inches without changing a single gear. Again, by making extra change gears for the quadrant plate, practically any thread can be cut between the limits of 100 threads per inch and 5-inch lead. The relieving attachment supplied with the lathe, when equipped for toolroom work, is universal, being thus applicable to external, parallel, taper, angular and spiral reliefs, or to internal and end reliefs.

Bed and Headstock Spindle

The bed is unusually deep and rigid, and is thoroughly braced with cross ribs of box section. It is provided with three inverted vees of liberal proportions. The headstock and the tailstock each rest on one vee and one flat surface, while the saddle bears on two vees and also on the flat surface. The brackets attached to the bed are made with a tongue fitting into a groove in the bed, and the rack is of steel securely screwed and dowelled to the bed.

The headstock throughout is unusually massive, and is of the three-step cone, double-back geared type. It is made with split phosphor bronze spindle bearings, which are provided with large oil wells to ensure ample lubrication at all times. The back gear eccentric has been moved to the front of the lathe instead of the back, a feature which has several important advantages. In the first place, the eccentric handle is at the front of the lathe, avoiding the necessity of the operator reaching over the lathe with the accompanying danger of getting caught in the belt. Another advantage is that the wear on the front spindle bearing is much more even, this being brought about because the back gear pinion, when the back gear is engaged, pushes the spindle down in its bearing in opposition to the upward thrust from the tool point. These forces, when the tool is at the pitch line radius of the spindle gear, balance each other, leaving only the pull of the belt to cause wear on the spindle bearing. With the back gear pinion at the back, the pinion and tool thrusts are both upward, causing greater wear on the top half of the spindle bearing. The gears on the head are entirely enclosed, but at the same time are readily accessible, as the headstock is built up to the centre line of the spindle, and the gear covers drop on the planed faces at the front and back, being located by means of dowel pins. The covers lift off readily, simply resting in position by their own weight.

Spindle and Belt Shifter

The spindle is made from special high carbon spindle steel, and has a hole bored from the solid throughout its entire length. It is accurately designed to facilitate putting on chucks or face plates. The plain part of the spindle nose is longer than the thread portion, thus centering the face plates before they enter upon the thread.

A C. M. C. improved belt shifter, for rapidly and safely shifting the belts to any of the steps of the cone, is part of the regularly fiurnished standard equipment. It consists of an arm with a belt guide carried on the head, and provided with a self-locking pin for securing the arm centrally over each step. A corresponding shifter is provided on the countershaft, and by means of the manipulation of these levers, the belt may be shifted to any desired cone step in the minimum time without the operator endangering himself.

Feed and Screw-cutting Changes

The feeds and screw-cutting changes are instantly obtainable by the movement of a lever to any of the different locations shown on the index plate. The thread of the lead screw is used for screw-cutting only. The lead screw is reversed for right and left-hand threads by means of the reverse plate on the head. The forty-four quick change feeds are obtained in a new design of quick change box having only two handles. This arrangement is specially convenient, besides having the advantage of rapidity of action. A quadrant plate is supplied to carry the intermediate gear between the head and the quick change box. This makes the lathe elastic in its screw-cutting capacity, for by getting special gears made, practically any thread can be cut between the limits of 1/100-inch pitch and 5-inch pitch. All the quick change gears are made of steel.

Quick Thread Cutting

A quick thread-cutting arrangement is incorporated in the design of the head as part of the regular equipment. This is accomplished by putting the reverse plate and gears inside the back bearing of the spindle in the head, means being provided for sliding the reverse plate 13/16 of an inch, so that the stud gears mesh with the cone back gear pinion, which is of the same number of teeth and pitch as the feed gear pinion on the spindle. The back gear is made of ten-to-one ratio, which means that when the back gear is engaged, quick threads may be obtained ten times as coarse as the threads on the thread index plate, with equal gears driving from the head to the quick-change box. Many useful pitches can be obtained with this device, such as ⅝ in., 2-3 in., 5-6 in., 1 in., 1¼ in., 1 2-3 in., 2 in., 2½ in., 3 1-3 in., 4 in., and 5 in. The screw-cutting capacity of the lathe is vastly increased by this device.

Apron, Feed Friction and Tailstock

The apron is of the double wall type, and all shafts and studs have double bearings. The rear wall of the apron is made heavy and solid with the top where it is bolted to the saddle. The front plate is readily removable, and is comparatively light. The gears in the apron are all steel, and, where running loose on studs, are bronze bushed. An improved feature is the position of the friction engaging knob. This knob is lower than usual on the apron, giving more room for the hand when grasping it, and what is most essential in obtaining ample clearance for the knuckles, one knob engages either the longitudinal or the cross feed by turning to the right or to the left. Another advantage claimed for this location for a feed friction clutch is the fact that they run faster in proportion to a given feed than in the lathe with two separate frictions. This means there is no difficulty in making the frictions hold, only a light pressure on the knob being necessary. The feed handle and the nut clamp handle are interlocked, so that the feeds and screw cannot be engaged simultaneously. The feeds may be reversed at the apron by the lower lever. The saddle is made with a trough all round the edge, and has wipers to wipe the bed clear of chips. A locking handle is located at the front of the saddle for use when cross-feeding. The cross screw and the top slide screw have micrometer collar adjustments. The compound rest swivel is graduated in degrees.

The tailstock is of substantial proportions, and is arranged to set over to turn tapers. The barrel is graduated in inches. The locking handle is always in position at the rear, and no separate wrench is required.

Universal Relieving Attachment

A universal relieving attachment can be applied to any of these lathes, and is only supplied as an extra. It is arranged to do parallel relieving, both internal and external, taper relieving, and angular and spiral relieving. Any angle of taper can be relieved as the motion is carried up through the centre of the swivel in the rest. The attachment is driven off the spindle gear on to a pinion shaft at the rear of the lathe. This pinion shaft gears on to a lower spiral gear shaft by means of change gears and a quadrant, which is carried on the rear wing of the saddle. The spiral gear shaft drives a cross shaft on the cross slide of the lathe. This cross shaft carries right and left-hand relieving cams. The relieving cams give a vertical motion to the shaft running through the centre of the swivel slide. This shaft is arranged to work on to either of two oscillating levers in the tool slide, one of which is used for internal relieving, and one for external relieving. Provision is made for adjusting the amount of relief from nothing to ⅛ of an inch, either internal or external. When cutting spiral reliefs it is necessary to reverse the lathe in order to run back to start the tool for the next cut. The timing of the oscillation of the tool slide is not interrupted by reversing the lathe, as the oscillating motion is going on all the time that the lathe is reversed. The depth of cut is adjusted by means of the cross-feed screw, the arrangement being such that full use of the cross feed screw is obtained at all times. If desired, the relieving attachment and the taper attachment can be used at the same time to relieve long slow taper reamers.

Taper Attachment

The taper attachment is supplied only as an extra. It is of improved design, and has a fine adjustment for setting the taper swivel bar by means of a worm with micrometer adjustment and segment. The connecting bar to the cross slide is guided at both front and back of the taper swivel bar, this construction overcoming the excessive cross-wind with the corresponding friction in the cross slide.

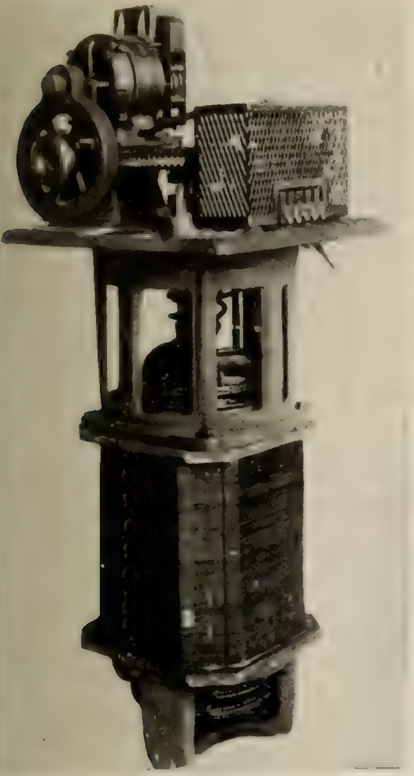
The lathe is furnished with a two-speed countershaft, friction pulleys, steady head, follow rest, two face plates and all the necessary wrenches. Other attachments, which are extras, embrace the following:—Universal relieving attachment, taper attachment, pump and pan, turret on saddle, turret tool post, turret on bed, automatic stop for saddle, all-geared head, and motor drive.

◆

IMPROVED DESIGN INDUCTION FEEDER VOLTAGE REGULATOR

AFTER a considerable amount of engineering and experimental work, with a view to improving the electrical performance and mechanical details, the Westinghouse Electric & Mfg. Co., East

Pittsburgh, Pa., has placed on the market the improved design feeder voltage regulator, illustrated. This is a single phase induction regulator, known as type C, for 2,300 volts, 60 cycles, 10 per cent. regulation, and it is standardized in all ratings from 5¾ k.v.a. to 69 k.v.a. The refinements secured in this new design have increased the reliability of the regulator in service, and have simplified and decreased the expense of the wiring necessary for installing accessories for automatic operation, in addition to improving the electrical efficiency.

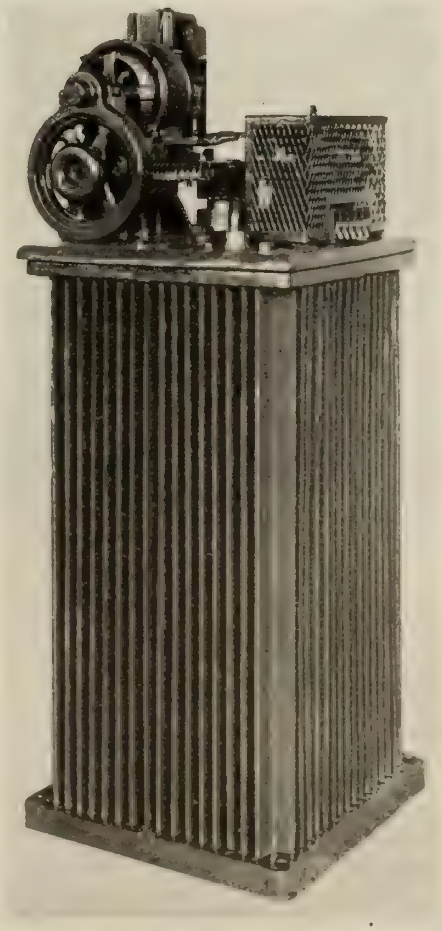


REGULATOR UNIT REMOVED FROM TANK.

The rotor is wound with form-wound coils, and constitutes the primary element. The short circuiting coils in the stator are formed from a large number of turns of relatively small size enamelled copper wire, thus reducing the watts loss in these windings without decreasing the neutralizing effect for which they are provided. The stator core is of the frameless construction so largely used in induction motors. With this form of construction the cross section of the stator core is increased without a corresponding increase in size of other parts and of floor space, resulting in a decrease of iron loss and exciting current. Further, the insulating oil in which the egulator is immersed in the tank comes n direct contact with all surfaces of the tator core with more efficient cooling ffect.

In a regulator the insulation of windngs is of vital importance because of he severe conditions of operation. The coils for both primary and secondary are, therefore, carefully insulated and impregnated, and are assembled in open slots. They are held by fibre wedges driven in small grooves at the top edges of the slots. Heavily insulated steel bracing rings are assembled around the exposed ends of the stator coils at both ends of the core. These rings are bound to the coils with cord, and greatly stiffen the coils against distortion from mechanical shock caused by current surges in the feeder during periods of line disturbance or short circuit. This feature is an important one, increasing the protection to the coil insulation and the factor of safety of the regulator in service.

An electrically controlled switch or auxiliary relay for the operating motor, formerly mounted separately from the regulator, is now mounted directly on the regulator top cover and includes the limit switch. This arrangement cuts down the number of wires required in the control circuit for automatic operation, and simplifies and lessens the expense of installation. The chance of failure in the control circuit is correspondingly lessened as well, and inspection of the wiring is made easy. The operating motor is provided with a quick acting magnetic brake as heretofore, but the operating mechanism has been changed, so that the regulator now requires only ten seconds for the complete range of travel from maximum buck to maximum boost, 20 per cent. regulation.



COMPLETE APPARATUS WITH REGULATOR UNIT IN POSITION.

The regulator is made as a unit, and may be quickly removed from the tank by simply unbolting the top cover, thus making inspection and repairs comparatively simple. The tank is formed from sheet steel walls with oxy-acetylene welded seams, and with top and bottom flanges cast on to the walls. This type of tank is the same as that used with Westinghouse oil insulated self-cooled transformers. It is strong without undue weight, and free from oil leakage. The radiation quality is necessarily very high.

◆

CANADA'S HUGE TRADE INCREASE

THE aggregate trade of Canada in four months has increased by more than 100 per cent. The July trade as shown in the monthly summary issued on August 24, the Hon. J. D. Reid, Minister of Customs, showed the phenomenal rise of 141 per cent., or $139,860,450. The total trade for the month amounted to $238,860,488, and for the four months ending July 31 it reached the total of $766,372,832, as against $371,646,906 in the corresponding period of last year.

Imports for consumption amounted in value to $63,622,587 in July as compared with $36,622,190 in July last year, while in the four months period they rose from $134,729,377 to $249,867,767. The July exports reached a value of $104,964,270 compared with $45,590,038. In the four months the exports have risen from $159,168,259 to $350,345,305. These are in the figures for domestic imports and exports only.

In the export of foreign merchandise there has been a notable increase, nearly one thousand per cent. The volume of these exports rose from $11,494,457 in the four months of last year to $122,627,072 in the same period this year.

An interesting feature of the statement is the substantial rise in the imports of free goods; there has been, however, a corresponding increase in the imports of dutiable merchandise, and the duty collected in the four months has risen from $28,085,471 to $46,063,507.

Shipments of Canadian manufactured products trebled in July amounting to $38,264,136, while the exports of farm products amounted to $38,585,309, or five times the total of July last year. Exports of foreign mine products, which were less than a million in July last year, reached a total of over fifty-four millions last month.

AFTER WAR TRADE AND MERCHANT MARINE SUPREMACY

ONE phase of the after-war world trade and commerce possibilities that is being given much less attention than it deserves is that relating to the comparative strengths, or more properly speaking, deadweight carrying capacities, of the then British and German merchant fleets. Due to the fact that the bulk of Germany's mercantile marine has been harbor-locked in her own and in neutral ports since the war started, tonnage losses through sinking and capture by Allied ships of war may be said to be almost negligible. It is computed, on the other hand, that Great Britain's merchant fleet alone will at the end of the present year be in round figures something like 4,000,000 tons less than its total on the outbreak of hostilities.

A twofold cause has been and still is in operation towards such a development, i.e., the maintenance of her international trade and the precedence given war vessel over merchant vessel construction. In the case of the former it was naturally to be expected in view of the risks encountered that a large percentage of merchantmen of various types and tonnages must succumb in the struggle with even less ruthless enemy submarine warfare than what has actually been experienced. As regards the displacement of merchant shipbuilding by that of ships of war, while it may be possible that less drastic measures would have sufficed, our sea supremacy being so intensely vital, erring on the safe side has had everything to commend it.

Reference has been made in these columns on former occasions to the practically certain trade war which will ensue immediately that on the battlefields of Europe is halted. We, as already indicated, will enter the struggle with a handicap equivalent to 4,000,000 tons less shipping available, and, for that matter unprocurable for possibly a decade thereafter to come. Germany's merchant fleet as we have already observed will be practically intact, and ready to start operations, and having been in pre-war days our most formidable rival both as regards shipbuilding and shipowning, she, unless steps be taken otherwise, cannot fail to assume pride of place in international trade. Irrespective of the preservation of her pre-war merchant fleet with the exception of some 300,000 tons, she is reputed to have added, and to be still adding, materially to what, with the deduction of the above amount, may still be reckoned as an already respectable total of 5,250,000 tons.

It is computed that to make good Britain's 4,000,000 tonnage loss, ten years will elapse following the declaration of peace, and even then her normal annual output would have to be increased from 1,370,000 tons to 1,770,000 tons. The outlook, it must be admitted, is anything but reassuring, and when it is remembered that we will have to depend largely on our export trade to meet the cost of the war, and that arrangements have been made to blacklist entirely everything that savors of German origin, it becomes absolutely essential that we have on the sea a merchant marine as effective as that of its naval confrere, and as capable of victorious achievement as our armies now in the field.

To wait ten years to bring our shipping back to normal, is on the face of it ridiculous, for not only would Germany have been able to take advantage of the psychological moment, but she would, in the nature of things, at least be able to compete with us in producing new shipbuilding tonnage. As a remedy, and of course it must be a drastic one, it has been suggested that peace terms embody "a ship for ship" clause; incidentally, a money indemnity is thereby flouted. From every viewpoint, there will be few who will be found antagonistic to the proposal. We are familiar with the Old Testament dispensation which demands "an eye for an eye," a "tooth for a tooth," and "a life for a life," and making all due allowance for our living in a Christian era, the claim of "a ship for a ship" may easily both be pressed and satisfied.

Submarine piracy has deprived us of some of our largest and greatest masterpieces of naval architecture and marine engineering, as well as of a host of merchant vessels of varied type and size, and only by our demanding "ship for ship," in its type, tonnage and appointments, or their equivalent, will Germany be made to realize that she has been a party to submarine piracy.

Much of Britain's mercantile marine has been and still is employed in war-created service, which is equivalent to saying that such vessels have been subject to more or less reconstruction, and, on account of their exacting duties, will as a matter of fact be in line for more or less extensive overhauling when hostilities cease. Germany's bottled-up craft are, it is quite certain, being maintained at "concert" pitch. This is borne out by the statement—if true, of Herr Ballin, the German steamship magnate, which places the orders on the books of Fatherland shipyards at 1,250,000 tons. Such a total of itself comes within 120,000 tons of Britain's normal annual shipbuilding output. Its significance is more pronounced, however, when it is remembered that Britain's mercantile marine was in pre-war days four times as large as that of Germany. The idea is to have at least that ratio when the trade war begins, and no more effective way of reaching the objective is to be found than by Britain's peace terms making it essential that "ship for ship" be a front rank clause.

* * *

HIGHLY SIGNIFICANT!

THE fact that a debenture issue to the amount of one million sterling by Canadian Vickers, Ltd., has received the Imperial Treasury authorization, gives indication that not only is the importance of this enterprise highly appreciated in Home Government circles, but that considerable developments may be expected in the scope of its operations. Shipbuilding on a much more extensive scale than was perhaps originally planned will doubtless be the principal direction in which the additional capital will find an outlet.

INDUSTRIAL NOTABILITIES

WILLIAM JAMES CLUFF, president, Canada Pipe & Steel Co., 87 Church Street, Toronto; president, Cluff Bros., Ltd.; president Cluff Manufacturing Co.; president, Security Co.; director, Guardian Realty Co., was born at Toronto, March 20, 1877, son of James and Sarah (Perceley) Cluff. He received his education in Toronto public schools, and entered on a business career as clerk with the Toronto Radiator Company in 1892.

He took charge of the Canada Iron Pipe Co. in 1906; reorganized and re-established the Canada Pipe & Steel Co. in 1907; organized Cluff Bros., Ltd., in 1909; organized the Cluff Manufacturing Co. in 1912; and the Security Storage Co. in 1913.

WILLIAM JAMES CLUFF.

Mr. Cluff married Ruby Sullivan, daughter of James Sullivan, Toronto, on February 12, 1907, his family consisting of two daughters. His clubs are the Albany, Toronto; the Commercial, London, Ont.; and his recreations, fishing and boating. In matters of religion, Mr. Cluff is Anglican. His residence is 151 Springhurst Avenue, Toronto.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Aug. 28, 1916.—Industrial conditions continue to reflect a gradually increasing development in domestic activity, in addition to that for war material and supplies. The shortage of labor, added to the increasing difficulty of procuring steel, will doubtless further affect prices of raw material; therefore, advances in some lines are not unlikely. Recent developments in the European situation will strengthen the cause of the Allies and increased activity is as a result looked for. The railroad situation in the United States is causing much uneasiness in commercial and industrial circles, affecting as it will, should a breach occur, the transportation of munitions and other needed supplies.

Pig Iron

No change is noted in the general situation. Steel-making pig is as active as ever; the foundry demand also shows a slight improvement.

Steel

With the holiday season drawing to a close, and the gradual return to cooler weather, the output from the mills and foundries is assuming capacity figures. The increased use of plates and short beams for trench supports and protections have resulted in a strong demand for these products. Deliveries of billets and sheet bars are showing improvement, but producers are still taxed to the limit in supplying the demand. The nominal quotation for Bessemer billets and sheet bars is $45, maker's mill, Pittsburg, with open-hearth bars $2 higher. In addition to the increasing demand for plates for army use, the requirements of shipbuilders show no abatement. The situation in sheets remains firm, the demand for blue annealed and specials being good. Galvanized are quiet, the return of spelter to a higher level having left the market a little unsettled. Galvanized sheets are quoted at $4.25 Pittsburgh. The demand for wire products has quietened down, but mills are active in filling booked orders for future requirements. The local situation is unchanged, and dealers report prices as last week.

Metals

The general situation is unchanged, business, if anything, having slowed up somewhat after recent activities. Copper is firm, but quiet, following heavy buying. Tin is unsteady, but inclined to become firmer. Spelter is quiet, following the recent good demand. Lead is again quiet, with an undertone of weakness. Antimony is steady, but uncertain.

Copper.—Insistent demand continues to keep the smelters and refiners working at very high pressure, and while the requirements for war purposes are very heavy, it is estimated that the greater portion of the mined metal is being absorbed by industries for domestic contracts. The future outlook, in this respect, is very encouraging, and it is expected that the present activity will continue for some time. The immediate demand has somewhat slackened, but it is anticipated that buying will be renewed shortly. Consumers have been taking an active interest of late, and are covering their early requirements. Present conditions point to a strong market, with sellers in control

The London market has shown weakness in standard, and strength in electro, owing to increased demand for the latter, which shows an advance of £5, being quoted at £129 per ton. Owing to the recent heavy buying, both for export and home consumption, the New York market is very strong, quotations having advanced 1 cent on lake and 1¼ cents on electrolytic; the nominal price being 27½ cents for prime lake and 28¼ cents for electrolytic. Dealers here, while reporting an active market, are holding firm on quotations, which are 31 cents for lake and electro, and 30 cents for castings.

Tin.—The market retains the position it has held for some time and while there is apparently an added interest to the situation, that tends to keep firm prices, recent activities do not indicate that a buying movement is imminent. The present situation is largely affected by the uncertainty that prevails regarding the future shipments of tin, which at any moment may be restricted owing to difficulty in obtaining permits. London reports a slightly easier market, while the New York situation is firm on a ⅛ cent advance, the nominal quotation being 38¾ cents per pound. The local situation is unchanged, with prices firm at 43 cents per pound .

Spelter.—The situation in spelter has quietened down after the recent activity, but the market remains comparatively firm. The buying which of late has been quite heavy, appears to have reduced the supply of metal held by second hands, and the feeling in the trade denotes an undertone that may ultimately develop into a stronger market The London situation has shown improvement with an advance of £9 on spot and £2 on futures, quotations being £58 and £45 respectively. An advance of ⅞ cents on the New York market places the nominal quotation at 9½ cents per pound. Local dealers, while realizing the recent activity and the present firm tendency, are content to retain their quotations at 14 cents per pound.

Lead.—The exceptionally heavy demand during the past two weeks has placed the lead situation on a much sounder basis, but it is not likely to show further strength; in fact, dealers are of the opinion that the market will again decline, as recent cables would tend to confirm reports that both Britain and Russia are well covered for the next six months at any rate. However, the domestic demand has been very good of late, which might indicate that consumers have allowed their supply to run low, resulting in the recent heavy inquiries. London reports a steady market with slight advances. Following the activity during the past two weeks, New York quotations are higher, the Trust price having advanced from 6 cents to 6½ cents, while the outside interests are quoting 6¾ cents, an advance of ¾ cents per pound. The demand here, while above the normal has not been sufficient for dealers to advance prices, which are unchanged at 8½ cents per pound.

Antimony.—The improvement noted last week has eased off a little, but interest is still being shown, and consumers and dealers are apparently awaiting the trend of events before making further purchases. However, it is only on exceptional demand that this metal could return to a higher position, as the production has for many months greatly exceeded the requirement, even with many plants running under capacity. During the past two weeks the New York quotation has shown an advance of 3¼ cents, the nominal price now being 13¾ cents per pound. Local dealers are quoting 17 cents, but anticipate an advance if the strength of the market continues.

Aluminum.—The market continues strong and very firm with quotations unchanged at 68 cents per pound.

Machine Tools and Supplies

Little change is noted in the machine tool situation. Shell making equipment is still in demand. The requirements of munition makers are becoming fewer every day, although there are still inquiries for standard or special machinery, but in single pieces. Deliveries on placed orders are much better, although manufacturers are feeling the effect of a shortage of help, which has been gradually increasing for the past two months. Small tool supplies are still in good demand, as these commodities are required continually and under present conditions, in large quantities.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Scrap

The situation in the old metal market is quiet, with dealers quoting previous prices. Increased activity is shown in steel-making scrap and copper, while brass and lead are much stronger.

Toronto, Ont., Aug. 29.—The most important event locally is the Canadian National Exhibition, which opened last Saturday. There are, as usual, many interesting exhibits, industrial and engineering, while a new feature has been introduced this year in the form of a display of complete shells of various calibres showing the method of manufacture from the raw materials to the finished article.

A statement recently issued by the Customs Department shows that the trade of Canada in the first four months of the fiscal year has increased by more than 100 per cent. July was a remarkably satisfactory month, the returns showing an increase of 141 per cent. The shipments of Canadian manufactured products in July were three times the total for the corresponding month last year. Trade conditions in Canada are highly gratifying, and will help considerably in paying off the national indebtedness incurred owing to the war. The balance of trade is now exceptionally favorable.

Steel

The steel market is again very strong, and is unusually active for the time of the year. The enormous demand for steel for munitions and for other purposes connected with the war has resulted in a new buying movement in the United States and Canada. The mills have as much business booked as at any time before, and deliveries are getting as backward as ever, second quarter of 1917 delivery being about as early as can be promised now. Another upward movement has started in prices of steel products, the principal reasons being the shortage and increased cost of semi-finished material. The higher prices this week include an advance of 25c per 100 lbs. on steel bars, 25c per 100 lbs. on plates, and an increase of approximately 10 per cent. on boiler tubes. The situation as regards boiler tubes is perhaps tighter than in any other line, as the mills are sold up for eight to ten months on both locomotive and merchant tubes. Plates are also in heavy demand, particularly from the shipyards and boilermakers. The leading mills have their entire output sold for this year, and have taken large contracts for delivery in first quarter and first half of 1917. Prices of wire products continue very firm, and an advance is looked for about the 1st of September. The wrought iron pipe situation is unchanged, but prices may advance. Following the departure of the hot weather, production has materially improved, although the shortage of labor is adversely affecting the situation. The demand for shell steel, however, is so pressing that the mills are making a big effort to increase the output as much as possible.

The market on sheets is firmer and quotations have advanced on black sheets, but blue annealed are unchanged. The hot weather seriously hampered mill operations; the output, therefore, was curtailed and deliveries were further delayed. Prices of galvanized sheets are lower, due to the recent declines in spelter, but the high level of black sheets will tend to steady the market.

The steel market in the United States continues very firm, with prices advancing on some products and deliveries getting more backward. There has been an increase in domestic buying, but consumers are still inclined to be cautious on account of the present high prices. Steel bars are unchanged at 2.60c and shapes at 2.50c, but plates have advanced and are now being quoted at 4c f.o.b. Pittsburgh. Open-hearth sheet bars have declined $2, and are now quoted at $45 per ton Pittsburgh. Billets are unchanged, as are also Chicago warehouse prices.

Pig Iron

The situation in the pig iron market is unchanged, but it is believed that the next movement is likely to affect prices favorably. The heavy production of steel assures a big demand for pig iron for the rest of the year, and prices may accordingly advance.

Machine Tools

The active demand for munitions equipment continues, and local dealers report having received a number of interesting inquiries for machine tools for shell shops. Deliveries on large swing lathes are fairly satisfactory, although shipments are still being delayed in the local freight yards. American machine tool houses report that business booked by their agents in Great Britain is less desirable, due to the Order-in-Council, which calls for payment to the Government of 60 per cent. of the profits arising out of all business transacted in that country. One or two makers of grinders and shapers in the States have advanced their prices by approximately 10 per cent., and there is a possibility of an advance on planers in the near future.

Supplies

Business in machine shop supplies continues brisk, with prices of practically all lines very firm. Although there are few price changes of importance to note this week, higher prices on some lines, particularly in steel and brass goods are anticipated. Linseed oil is lower at 84c per gallon for raw and 87c for boiled oil. Crude oil continues weak but there has been no further decline in gasoline, while lubricating and lighting oils are also unchanged. An advance of 5 per cent. has been made on Disston hand saws.

Metals

The metal markets continue to display considerable activity and are firmer than they have been for some weeks. Although the markets generally are strong there have been no changes in prices with the exception of copper which has again advanced. Business locally continues very good for the time of the year and further improvement is anticipated. Metals for munitions are of course in good demand but ordinary business is keeping up well .

Copper.—The situation in the copper market is unchanged from last week and quotations are again a shade higher. Sales for November, and December are in large volume and export demand continues very heavy a great part, it is said, being for private consumers in the Allied Countries. The buying of the last three weeks is rapidly cleaning up the supplies for the current year. Quotations are higher and nominal at 30c per pound.

Tin.—The situation in the tin market is the same as last week and quotations locally are unchanged although London is higher. The market is quiet but firm with no feature of importance to note. Tin is quoted at 44c per pound.

Spelter.—The market is quiet, and it is reported that there have been some second hand offers at concessions. Producers are now well sold ahead and are not anxious to sell. Quotations unchanged at 14c per pound.

Lead.—The market is less excited now than it was at the beginning of the week, prices being firmly maintained. The Trust price of 6.50c New York, is unchanged but independent prices are higher at 6.75c New York. The demand for lead is now heavy and producers are sold farther ahead than ever before. Local price 8½c per pound .

Antimony.—The market is now dull following the recent heavy buying movement, quotations being firm but unchanged at 18c per pound.

Aluminum.—The market is dull and quiet and the situation unchanged. Local price 68c per pound.

U.S. INDUSTRIAL COMMISSION TO FRANCE

THE American Industrial Commission to visit France on the basis of unsolicited proposals made to the American Manufacturers' Export Association sailed therefor on Saturday, Aug. 23, on the steamship Lafayette. The object of the Commission is to make a technical investigation of present conditions in France looking to the reconstruction and reorganization of her communities and industries now and after the war. It is to determine also how the United States may contribute, as in largely increased purchases of French products. The French Government is to aid the Commission, partly through providing for transportation; the itinerary, will include some 25 cities. In the composition of the Commission as effort has been made to secure men of broad experience in some nine general classifications of industry and at the same time of a caliber calculated to lend dignity and standing to the enterprise. A printed report of the results of the commission's visit is promised.

W. W. Nicholas, assistant chairman Allis-Chalmers Mfg. Co., Inc., heads the commission as chairman. J. G. Butler, Jr., vice-president Brier Hill Steel Co., Youngstown, Ohio, and director of the Commercial National Bank, Youngstown, is scheduled to represent the iron and steel industry. Ambrose Swasey, Warner & Swasey Co., Cleveland, is also numbered in the party. Among others of the commission, some fifteen in all, are the following; A. B. Farquhar, president A. B. Farquhar Co., York, Pa.; James E. Sague, former vice-president American Locomotive Co. and Public Service Commissioner, New York; F. J. LeMaistre, consultant, E. I. du Pont de Nemours & Co., Wilmington, Del.; John R. MacArthur, MacArthur Brothers Co., New York; Dr. C. O. Mailloux, consulting engineer, New York; E. A. Warren, vice-president Universal Winding Co., Boston; Samuel W. Fairchild, vice-president Fairchild Brothers & Foster, chemists, 76 Laight Street, New York; Noble Foster Hoggson, president Hoggson Brothers, Inc., contractors, New York; E. E. Russell, J. I. Case Threshing Machine Co., Racine, Wis., and George Burdett Ford, Geo. B. Post & Sons, architects, New York. E. V. Douglass, secretary American Manufacturers' Export Association, 160 Broadway, New York, and secretary of the Commission, arrived in France last week.

LAKE SUPERIOR CORPORATION SUBSIDIARIES

AGGREGATE net earnings of the Lake Superior Corporation subsidiaries were $3,503,471, last year, as compared with $1,366,210 in the previous fiscal year. The larger income, however, did not go to the parent company, but remains in the hands of subsidiaries in the form of enlarged reserves and balances. The parent corporation's income consisted of interest on bonds of subsidiaries amounting to $290,000 and other income of $45,795, making a total of $335,759, as against one of $369,032 in the previous year. The disbursements out of income were somewhat less, being $310,305, leaving a net of $25,454. This added to the balance from last year leaves a sum of $50,526, of which $40,000 was applied to reserve for depreciation of securities and the balance carried forward.

Algoma Steel

The amount realized by the Algoma Steel from last year's sales compared favorably with the record year, 1913-1914. The tonnage in each of the last three years was as follows—

	1913-14	1914-15	1915-16
Pig iron, tons	311,904	212,917	258,504
Steel rails, tons	325,680	174,536	*215,416
Merchant. tons	15,576	8,903	......

*This figure includes rails, shell, and merchant steel.

The water power which the company owned has been disposed of for $1,000,000, which sum is held by trustees and is available for new construction.

IMPORTANCE OF INCREASED PRODUCTION

W. L. HICHENS, chairman of Cammell, Laird & Co., Birkenhead, England, delivered an address recently on "The Importance of Increased Production," at the outset of which he said that, as a large employer of labor, all questions of labor and capital interested him more than anything else, save that of the war. The war had given us a new angle of vision in regard to many things. Before the war we lived in an age of individualism.

The watchwords of the nineteenth century had been self-realization, survival of the fittest, laisser faire, and the interests of the individual. Employers organized themselves into a federation, and working people organized themselves into trade unions, and both were there for the purpose of seeking their own interests. That, of course, was not unnatural. The tendency was to think of their own interest as an individual first, and secondly of the interests of the class to which they belong. Politics wás regarded as a game in which each section played for its own ends, and justice was supposed to reside in numbers.

The war came, however, and straightway some three million men sacrificed their lives for their country. The clouds seemed to lift, the horizon became extended, and all realized that patriotism was opposed to individualism.

New Vision of Empire

The newer and wider outlook also applied in regard to their view of the Empire, and more particularly the Dominions. They realized that the life of the Empire was no mere sham, but was something that they realized with an intense keenness, and for which they were prepared to lay down their lives if necessary. Many of us had begun to dream dreams and to picture to ourselves the possible use of that wider form of patriotism after the war. We are surprised to find how far away we have drifted from the old individualism of pre-war days.

Before the war many men made it their ideal to put together a competence so that at the earliest possible moment they could retire and live happily ever afterwards, and how many young men and women there were who thought it no shame to live a life of idleness if they could afford to do so. Now, however, the oldest 'dugout'' in the country was rushing about to do his bit ashamed to be found idle when everybody had work to do. It is realized now that there in an unlimited demand for everything we can produce, and it was to be hoped that idea would not vanish when the war was over. It seemed that if it were a useful and essential thing for us to work to preserve our liberties, it would also be a valuable thing to work hard after the war for the sake of the happiness and welfare of the whole community.

To-day there was an unlimited demand for everything that could be produced. We wanted munitions for ourselves and for our Allies. We also wanted to produce as far as possible other things as well as munitions which could be exchanged abroad for something that would serve our immediate purpose. Munitions of war from abroad could be paid for in four different ways. First, by the selling of American Dollar Securities; second, by exporting gold; third, by raising loans with countries in which we wished to trade, although that was not an unlimited source of supply; fourth, and this was the most important of all, we could exchange goods exported for munitions and that was the most satisfactory way of achieving our object.

Development of Export Trade

A very great deal had already been done in the way of increasing their exports. The latest figures showed that the exports of Great Britain in May, 1916, were worth £47,000,000; in May, 1915, they were £33,500,000; and in August, 1914, they were only £24,000,000. That was, of course, a very large and satisfactory increase, and if we would only go on increasing at the same rate our national standing financially would quickly show substantial improvement.

There were two ways in which we could do more. The first way was to increase Government organization, but Mr. Hichens did not think a very great deal could be done in that way, because for his part he did not think the Government were very good organizers, and for another thing he did not think they had very good material to work upon. It was true they all had the defects of their qualities, but even so he preferred the truculence and the steady independence which characterized the Englishmen to the subservience of a more docile people. If they had to pay the penalty of being lovers of freedom it was a price worth paying.

The Shipping Problem

One of the things the Government could do was to direct with more practical thought the vital shipping interests of the country. Nearly a year ago he had tried to get a committee appointed of shipowners and Admiralty officials to organize the shipbuilding capacities of

Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department is able to present the following list of the moreimportant British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

BRAZIL
Bahia, British Consul.
Rio de Janeiro, British Consul General.

CHILE
Valparaiso, British Consul General.

COLOMBIA
Bogota, British Consul General.

ECUADOR
Quito, British Consul General.

EGYPT
Alexandria, British Consul General.

FRANCE
Havre, British Consul General.
Marseilles, British Consul General.

INDIA
Calcutta, Director General of Commercial Intelligence.

ITALY
Genoa, British Consul General.
Milan, British Consul.

MEXICO
Mexico, British Consul General.

NETHERLANDS
Amsterdam, British Consul.

PANAMA
Colon, British Consul.
Panama, British Vice-Consul.

PERU
Lima, British Vice-Consul.

PORTUGAL
Lisbon, British Consul.

RUSSIA
Moscow, British Consul General.
Petrograd, British Consul.
Vladivostock, British Consul.
Odessa, British Consul General.

SPAIN
Barcelona, British Consul General.
Madrid, British Consul.

SWEDEN
Stockholm, British Consul.

SWITZERLAND
Geneva, British Consul.

URUGUAY
Monte Video, British Vice-Consul.

VENEZUELA
Caracas, British Vice-Consul.

this country. It was obvious that additional ships were badly wanted. It seemed quite clear that such a committee could see that every shipbuilding yard was occupied on a type of work most suited for it. That would have been a very great gain to the country. He also thought it would have been a very great gain if the merchant shipping was more standardized in this country, so that they might concentrate more on quantity that on quality. He was told that such a plan would be very difficult of application if not impossible. However, they would notice that quite recently a powerful body of shipping experts had formed themselves together to produce just these same standardized ships, which the Government had said were impossible.

He was still in hopes that the Government would do something in the matter, but for the moment they had to depend in the main on their own individual enterprize and effort. He felt confident that production could be largely increased, because it was still in them to make a very much bigger effort than had yet been done. Before the war, statistics showed them that two and a half times as much work per working head was turned out in U.S.A., as compared with Great Britain. Of course there they had more labor-saving devices. The fault of this lay with British employers, who did not take the trouble to find out the best and newest appliances, because they felt that they could rely upon a cheap labor supply.

⁂

Trade Gossip

The Dominion Brake Shoe Co. has increased its capital stock to $200,000.

The Pembroke Electric Light Co., of Pembroke, Ont., has increased its capital stock to $250,000.

The Burlington Steel Co., of Hamilton, Ont., has been awarded a contract for the reinforcing steel for the new Parliament Buildings at Ottawa.

Montreal, Que.—Controller Coté suggests that makers of turbine machinery be asked to examine the proposed aqueduct power scheme which will cost one million dollars, before a consulting engineer is appointed.

William Phillips, European manager of the Canadian Northern, sailed for New York on the Saxonia last Saturday to assume duties in the head office at Toronto. Before leaving he received the thanks of the Lord Mayor of Bristol for the interest he had taken in that port's commercial shipping relations with Canada.

Canadian Union of Municipalities.—At the meeting of the Canadian Union of Municipalities, held at Montreal on August 23, the following officers were elected:—Honorary patron, Hon. Robert Rogers; honorary president, Mayor T. L. Church, Toronto; president, Ald. Leslie H .Boyd, K.C., Montreal; first vice-president, Mayor Stewart, Victoria, B.C. (where the next meeting of the union will be held); second vice-president, Mayor Stevenson, London; third vice-president, Mayor Hardie, Lethbridge; honorary secretary-treasurer, W. D. Lighthall, K.C., ex-Mayor of Westmount, Que.

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

The Spirit of the Times

"Service and Co-operation"

THE CANADIAN NATIONAL EXHIBITION—itself an expression of the Spirit of the Times—affords our Service Department an opportunity of demonstrating what our organization has achieved in the attainment of its ideal of Service and Co-operation

IN MACHINERY HALL we will show some of the principal tools used in the manufacture of 9.2 High Explosive Shells, such as Boring and Turning Lathes, Band Turning Lathes, Cutting-off Machines, etc., also a line of general purpose tools and equipment for the Tool Room consisting of tool room lathes, sensitive drills, etc. In our Woodworking Department we will show standard lines of band saws, planers, jointers and saw tables.

IN THE PROCESS BUILDING we will operate a toy-making plant, showing a number of interesting operations.

COME AND SEE US during the Big Show. Our representatives are willing and ready to give you the benefit of their experience without obligation. We are there to "Save and Serve."

IN OUR WAREROOMS on Front Street we have a large stock of wood and iron tools for every branch of industry. We are offering special inducements during the Exhibition. It will pay you to buy now.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Montreal, Que.—The Montreal Tramways Co. will build an addition to the St. Denis sub-station.

Hamilton, Ont.—The Acme Stamping & Tool Co. contemplate building an extension to their plant.

Vancouver, B.C.—The management of the Hotel Vancouver here have decided to instal a power plant.

Niagara Falls, Ont.—Work has been commenced on the erection of a plant for the Canadian Aloxite Co.

London, Ont.—The George White & Sons Co. will build an extension to their plant here to cost about $12,000.

Thetford Mines, Que.—The foundry owned by La Fonderie de Thetford, Ltd., was recently destroyed by fire. Loss, $75,000.

Renfrew, Ont. — The International Molybdenum Co. is planning an electrically operated refining plant here at a cost of $150,000.

London, Ont.—London Rolling Mills Co., propose erecting an addition, to their plant to cost $50,000. New machinery will be installed.

Welland, Ont.—The Canadian Steel Foundries, Ltd., have purchased a property here adjoining their plant in view of extensions in the future.

Glenora, Ont.—J. C. Wilson & Co., are in the market for an overhead traveling crane, hand power or electric driven, capacity 5 to 10 tons, to span from 40 to 50 feet.

Toronto, Ont.—The plans for the William Davies Co. new abattoir, have been prepared by Henschien & McLaren, of Chicago. The buildings will cost about $200,000.

Toronto, Ont.—Lightning on Aug. 22 damaged the plant of the Interurban Electric Light Co., 215 Mavety Street, to the extent of about $5,000. The damage was confined principally to one of the large dynamos.

Toronto, Ont.—Earl Grey School on Jones Avenue will be heated next winter with crude oil. An oil burning apparatus has been installed in the school. It is the first school in which this has been adopted, and if it is successful other large schools and buildings may adopt this method of heating.

New Westminster, B.C. — Henry Schaake of the Schaake Machine Works, proposes to establish a modern machine shop and foundry here on the water front. The plans also include a ship repairing plant.

New Westminster, B.C.—The Saskatchewan Steel & Bridge Co., with plants at Moose Jaw and Medicine Hat, is planning to establish a plant on the coast with the ultimate intention of going into the steel shipbuilding business. A representative of the company recently visited this city with a view to selecting a suitable site.

Niagara Falls, Ont.—The Perfection Tire & Motor Co., manufacturers of automobile tires and mechanical rubber goods, will erect a factory in this city, providing the ratepayers ratify a by-law which will be presented to them in three weeks. The by-law provides that the city furnish the company with power at $10 a h.p. for a period of ten years, also give the company a fixed assessment for this time.

Brantford, Ont.—In sixty days it is expected that the new factory of the Dominion Steel Products Co. will be completed and ready for operation. The building will be 90 by 370 feet and will be entirely constructed of steel and glass. The new factory will be in close proximity to the L. E. and N. Railway track and the contract for its erection has been let to the Austin Co., of Cleveland, Ohio. The cost will be in the neighborhood of $65,000.

New Westminster, B.C.—A first-class steel shipbuilding plant and repair yard to be located here is the plan of John R. Duncan of the Vulcan Iron Works. It is proposed to establish at once a boiler shop and foundry and later on a steel shipbuilding plant. The plans call for an investment of $150,000 at once and about $200,000 more when the drydock is built. The equipment planned for the new establishment includes the heaviest plate rolls on the Pacific coast, weighing 55 tons and capable of handling steel plates one inch thick and 18 feet wide. The drydock will not be built while steel commands its present inflated price, although temporary marine ways may be built for proposed site adjoins the C. N. R. terminals in this city.

General Industrial

Port Stanley, Ont.—It is proposed t erect a grain elevator here at a cost o $100,000.

Windsor Mills, Que.—The Canad Paper Co. will build an extension t their mill here.

Kitchener, Ont.—The Canadian Co solidated Felt Co., propose building a addition to their factory.

St. Jerome, Que.—The Canadian Co solidated Rubber Co., of Montreal, wi build an extension to their factory her

Toronto. Ont.—Harry Webb & Co. wi erect a factory and bakery at Kend Avenue to cost $78,000. A building pe mit has been issued.

Brockville, Ont.—A grist mill Phillipsville owned by Reuben Haski was burned on August 24. The lo is heavy as no insurance was carried.

Drummondville, Que.—Fire on Augu 20 destroyed the blending house and large amount of powder at the Aet Chemical Co. plant here. The damage estimated at $20,000.

St. Thomas, Ont.—It is understo that the Monarch Knitting Co. will r move all the machinery, etc., from t spinning department at the local facto to the St. Catharines factory.

Hamilton, Ont.—A new industry w probably be located here, a meeting ha ing been held recently with the obje of forming a $100,000 company for t manufacture of plain and fancy b cuits.

Stratford, Ont.—At a special meeti of the city council on Saturday it w unanimously agreed that the city wou accept the $17,500 offered by the Kind Bed Co., of Toronto, for the Kemp fa tory. P. E. Kroehler is president a general manager of the firm.

Montreal, Que.—Thompson & Norr of Grand Falls, Mass., who have a bran here, propose building a factory on lorimer Avenue, to cost about $800,0 The Atlas Construction Co., of this ci are the general contractors.

Vermilion, Alta.—The Hayward Lu ber Co., of this place, will proceed once with the erection of a 30,000-bus grain elevator on the C.N.R., also of coal shed to have a capacity of 200 to of coal; this building will be alongsi

the elevator. The company will also erect an elevator at Kitscoty, both elevators having a capacity of about 30,000 bushels.

Vancouver, B.C.—The British Columbia Sugar Refinery has been granted a permit for the construction of an addition to its factory on Powell St.

Guelph, Ont.—A deal has been closed whereby the Partridge Rubber Co. will take over the business of the Standard Tire & Rubber Co., of this city, carry out the contracts, etc., and besides this will transfer the Montreal business to Guelph. The Montreal factory has been engaged in the manufacture of all sorts of small druggist rubber goods. The purchase price was about $150,000.

Electrical

Arthur, Ont.—The Town Council propose spending $15,000 on a hydro-electric system.

Scarborough Junction, Ont.—At a meeting of Scarboro Township residents on Monday, it was unanimously decided to request the Township Council to submit a contract to the Hydro-Electric Commission for the extension of the Hydro into several parts of the municipality.

Trade Gossip

Montreal, Que.—The Victoria Pier will be formally opened by H. R. H. the Duke of Connaught at the end of next month, on the occasion of the Duke's farewell visit to Montreal. This event will not only mark the completion of another important undertaking, but will be the forerunner of similar and extensive developments along all the harbor front.

Canal Co. Raises Rates.—The Manchester Ship Canal Co., which controls the port of Manchester, England, has announced that rates for discharging and loading vessels and for quay porterage, warehousing and storing in the open of merchandise and minerals, have been raised 12½ per cent. Ship canal tolls and wharfage and ship dues have been raised 5 per cent.

Quebec Bridge.—The final span of the Quebec bridge will be placed in position on September 11, weather permitting. At five a.m. the span will be floated from its present place on the bank of the river to the centre of the stream, under the bridge, and there raised and placed in position. The span weighs about four thousand tons and will be raised about 150 feet.

The Port Hope Sanitary Mfg. Co., which was recently organized to take over the Standard Ideal Co. of Port Hope, Ont., is capitalized at $1,250,000. The following directors have been appointed:—L. M. Wood, of J. & L. M. Wood, president; R. J. Cluff, president of the Cluff Manufacturing Co., vice-president; W. D. Ross, vice-president of the Nova Scotia Steel Co.; C. J. Cluff, president of the Canada Pipe & Steel Co., and M. L. Davies, vice-president of the Standard Chemical Co., directors.

New record Ore Shipments.—Great lakes ore carriers established a new record in the month of July, loading 4,750,157 tons, which exceeds by 242,581 tons the movement in June, which at that time was thought to have set a mark that could stand for a year. Up to Aug. 1 ore shipments for the season aggregated 29,365,724 tons, a gain of more than 5,000,000 tons over 1913, the banner year of the trade. Detroit vessel men predict that the year's movement will approximate 59,000,000 tons.

C.P.R. Orders Cars—The C.P.R. has ordered ten thousand new box cars, while at the same time it is keeping up its rail equipment by giving considerable orders to the Lake Superior Co., which now turns out as good rails as are manufactured anywhere on this continent. Thirty years ago the company had about 50 locomotives. To-day it has 3,000; it also has 100,000 freight cars, 2,500 first and second-class passenger cars, to which number it is always making additions.

Canadian War Purchases.—The purchasing department of the British War Office in Canada, organized under Lord Shaughnessy and employing systems and machinery of the C. P. R., had placed up to May 1, a total business in Canada for various general supplies, not including munitions, of $13,000,000. Since then the business placed has amounted to over $4,000,000, making a total of over $17,000,000, more than $7,000,000 of which represents transactions during the current year. About the most important business which has been received since last report covers additional orders for canned beans with pork to the extent of about 12,000,000 cans.

To Make Munitions—The St. Lawrence Bridge Co. has commenced the installation of about $500,000 worth of machinery for the preliminary order for $2,000,000, having been received from the Imperial Munitions Board. The company for the past few years has been concentrating upon construction work for the Quebec bridge. It is believed that in the course of a few months they will be one of the biggest producers of special war products in Canada. The St. Lawrence Bridge Company is controlled

Labor-Saving and Profit - Increasing Machines Galore

It's only once in a year that you get such an opportunity of seeing the world's greatest display of labor-saving machinery *in action.*

Remember the Date

Exhibition of Foundry and Machine Shop Equipment—

CLEVELAND, OHIO
SEPT. 11th TO 16th

Be Sure to Come

There are machines in the *Exhibition of Foundry and Machine Shop Equipment, Cleveland, Sept.* 11*th to* 16*th,* that you wouldn't be without for a minute if you knew what great services they were performing for the foundry world.

Send your general manager, your general superintendent, your purchasing agent and shop foreman—they'll return to your plant with ideas that will be of tremendous value to you.

There'll be a lively time. The entertainment committee has provided an endless round of gayety.

Lay your plans to attend now. Write us to make your hotel reservations.
Full particulars on request.

Blacklisted Firms' Insurance. — The Controller of the British Foreign Trade Department has made public a license issued to British underwriters and insurance companies to carry into effect marine insurance contracts made with persons in the United States, nothwithstanding such persons may be on the statutory blacklist, provided such contracts were made prior to these persons being placed on the list. According to a cablegram received by the Department of commerce from the American Consul-General at London, this license applies to any contract for marine insurance or insurace against fire, or any other risk of goods or merchandise during transit from the shipper's or manufacturer's warehouse until deposited in a warehouse on the termination of transit where any part of the routing is by sea.

Pulp Shipments to U. S.—Over two-thirds of the more than a billion pounds of wood pulp imported into the United States during the fiscal year ending June 30, 1916, and used in the manufacture of paper, came from Canada, according to a communication to the National Geographic Society, from John Oliver La Gorce, and issued by the Society as a bulletin in connection with the Government's inquiry into the increase in the cost of newspaper. The pulp importations for 1915-16 have been 180,000,000 pounds less than for the previous twelve months, yet the amount imported from Canada during the past year was 130,000,000 pounds in excess of her 1914-15 shipments. During the year just closed nearly 70 per cent. of the 1,135,000,000 pounds of U.S. imported pulp came from Canada, while most of the remaining 30 per cent. came from Norway and Sweden.

Nickel Refining Company Formed.—The Canadian branch of the International Nickel Co., which is to undertake the manufacture of nickel in Canada, has been incorporated at Ottawa by letters patented under the name of the International Nickel Co., of Canada. The new company is empowered to produce, refine, smelt, etc., nickel, copper, iron, steel, cobalt and other minerals, and to occupy and develop lands and concessions relating to or containing nickel, copper, iron, etc. The incorporators of the new company are Britton Osler, K. C., Toronto; W. A. J. Case, and the usual number of office employees. A meeting of representatives of the Ontario Government will be held in Ottawa very shortly, when the plans of the company and the question of the selection of a site will be taken up. The new plant

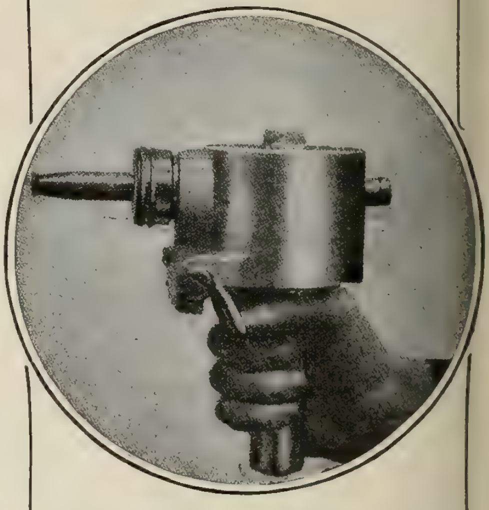
The Metals Coating Co. of Canada, Ltd.
Versailles Building, 90 James St.
MONTREAL, CANADA



A machine gun making its ammunition from Reeled Wire, and coating objects by bombarding with minute plastic particles of metal. The **Schoop method** of Metallic deposition, any object and any size coated with a positive adhesive and homogeneous coating with any metal for any desired thickness.

Solves one of the greatest problems heretofore confronting the structural engineer, because it produces on iron or steel a permanent coating not susceptible to corrosion.

Carbons can be coated with copper, etc.

will probably be built in units, and will provide a production of 12,000,000 to 15,000,000 pounds a year at the beginning.

Trade Inquiries.—The following inquiries relating to Canadian trade have been received by the Department of Trade and Commerce, Ottawa.

915.—Malleable Castings.—An Aberdeen firm will be glad to enter into correspondence with Canadian concerns prepared to quote for malleable castings cast to pattern.

922.—Kerosene or Petrol Engines.—A London firm of engineers wishes to purchase a number of kerosene or petrol engines; according to details obtainable from the Department, and invites offers, accompanied by full particulars, from Canadian manufacturers. The following is the specification given in their letter:—"The series of engines are required for electrical, agricultural and similar purposes, and should be of medium speed, not more than 1,400 to 1,500 in the small powers, and not lower than 600 in the larger sizes, the powers being from 1 horse-power up to 60 or 70, or even higher. Kerosene carburetters, etc., must be able to be fitted when required, otherwise petrol will be used, but should any engine answer to the above specification and yet be adapted only for petrol, we should still be pleased to have particulars. A separate price is required for bedplates, and blue-prints showing over-all dimensions should be submitted, together with delivery and prices."

The Tash-Orr Mines, Ltd., of Ontario, capitalized at $3,000,000, has been incorporated at Ottawa by Baltimore, Md., business men to develop gold-mining claims at Tashota, Ont., a new field. Joseph Castelberg, is president; Gustav H. Nachman is vice-president; John L. Orn, of Buffalo, N.Y., is general manager. The mines are located in the Kowkash mining district, about 300 miles west of Cochrane, on the new Transcontinental Railroad. William F. Green has been engaged as engineer and works manager. A compressor, boiler, hoist and air drills have been installed and the company will immediately erect a twenty-stamp mill, which will constitute a unit for other stamps to follow.

Granby Copper Output Increase.—Copper production of the Granby Consolidated Mining, Smelters & Power Co., in July amounted to 4,368,846 lbs. This compares with 4,011, 361 lbs. in June and 4,727,929 lbs., in May, which was the high record output.

Of last Month's total 3,092,274 lbs. were produced at Anyox, compared with 2,799,540 lbs. in June and 3,383,230 lbs.

3 BIG REASONS WHY YOU NEED
PURO
(MADE IN CANADA)

1. Puro Sanitary Drinking Fountains will give you a *better* water supply *cheaper*.
2. Puro will cut your water bills 15% to 35%.
3. PURO will safeguard the health of your employes and raise the standard of efficiency.

Are not these reasons enough? Then why hesitate lorger?
PURO equipment is not expensive—the first cost is *low* and the up-keep *nothing*. Easily attached; positively fool proof. Let us make you a special proposition for a try-out in one of your departments. Write us now—to-day—giving us the number of men; an inquiry will cost you nothing.

We can finish steel stamping in Nickel, Brass or Copper.

Send us a sample order.

W. H. BANFIELD & SON
372 Pape Avenue, Toronto, Can.

St. John, N.B., has resigned to accept the position of vice-president of Brown's Copper & Brass Rolling Mills, Ltd. This company has recently made large additions to the plant, which is located at New Toronto, Ont.

Earl McIntyre, for 17 years connected with the Republic Iron & Steel Co., Youngstown, Ohio, but who resigned recently to take the position of field engineer for the Canadian Steel Corporation at Ojibway, Canada, was presented with a chest of silver by his associates in the Republic Company offices.

Charles Pascoe, formerly metallurgist for the Canadian Steel Foundries, Ltd., and recently connected with the Thomas Davidson Mfg. Co., Montreal, as consulting metallurgist, has joined the Snyder Electric Furnace Co., Chicago, as metallurgist in that company's electric furnace research plant, at Clearing, Ill. Mr. Pascoe's work in connection with the Thomas Davidson Mfg. Co. had to do with the production of shell billets from a Snyder electric acid steel furnace, and his work in this connection has been peculiarly successful, as evidenced by the fact that approximately 90 per cent. of the billets passed inspection.

Dr. Walter Alexander Riddell, late Director of Social Surveys for the Methodist and Presbyterian Churches in Canada, has been appointed Superintendent of the new Trade and Labor Department of the Province of Ontario, created by the legislation of last session. The department includes several branches of the service which formerly acted independently—the Boiler Inspection Branch, Factories Inspection, Stationary Engineers and Labor Bureau. Dr. Riddell will probably commence work by a tour of the United States, and possibly Great Britain, in order to study the methods of employment bureaus, the organization of which will form an important part of the task of the new department. The new superintendent is a native of Stratford, Ont., and is 36 years old.

Wood-Working

Quebec, Que.—The sawmill of Alex. Gagnon, of Chicoutimi, was destroyed by fire on August 22. The origin of the fire is unknown. The loss is estimated at about $40,000. The insurance carried amounted to $15,000.

New Westminster, B.C.—The Acorn Lumber & Shingle Co., which has recently been incorporated, is building a shingle mill here. The mill represents an investment of $10,000, and will have a capacity of 100,000 shingles per day. M. D. Irvine is at the head of the new concern.

Steel Shell Forgings or Billets of any size or weight will move any distance or about curves upon our specially constructed Gravity Carriers and Incline or Horizontal power devices. No labor required.

KEYSEATER

for Milling Internal Keyseats

This tool is an attachment for the drilling machine, and is regularly made with straight shank for gripping in the drill chuck; taper shank can be had if desired. The tool is fitted with a high speed steel rotary cutter for milling internal keyseats in one cut. To complete a keyseat it is only required to pass the tool through the hole just once. Innumerable inexpensive eccentric bushings are supplied whereby the tool may be bushed to meet any diameter above its own.

Municipal

Milton, Ont.—The Town Council propose spending $5,000 on additional fire equipment.

Halifax, N.S.—The City Council contemplate the construction of an abattoir at an estimated cost of $25,000.

New Toronto, Ont.—By-law granting the Du Pont Fabrikoid Co. a fixed assessment, carried by the ratepayers 91 to 7 on August 19.

Maillardville, B.C.—A waterworks system will be installed here. F. L. Macpherson, engineer of Burnaby, B.C., has charge of the work.

Swift Current, Sask.—An additional unit will probably be installed in the municipal power plant Gas or steam power are being considered.

Chatham, Ont.—A by-law authorizing an expenditure of $16,600 for new water mains to the sugar factory and the cemetery has been passed by the council.

Winnipeg, Man.—The Board of Control may decide to purchase a number of motor trucks for the scavenging and street cleaning departments.

Lethbridge, Alta.—By-law favoring a filtration system was carried by a vote of 382 to 76. Money by-law will now be submitted in order to finance the scheme.

North Bay, Ont.—A by-law will be submitted to the ratepayers shortly to authorize a bond guarantee to the Queen Hat Mfg. Co., who propose building a factory here.

Peterborough, Ont.—The city council propose installing an activated sludge sewage disposal system which will cost $125,000. The Provincial Board of Health are dealing with the matter.

Dunnville, Ont.—A by-law will be submitted to the ratepayers on Sept. 25, to authorize a bond issue of $53,000 to pay for the installation of a hydro-electric system.

Hamilton, Ont.—The city will engage Engineer Milne, of Toronto, to report on the proposed waterworks plant and send a deputation to Buffalo, Cleveland, Detroit and other lake port cities where modern waterworks systems have been installed.

London, Ont.—Tenders for a motor tractor have been received by the Board of Control. They will be passed along to the City Council at its next session, and in the meantime no figures will be published. Two types, front drive three-wheeled, and rear drive four-wheeled, have been offered.

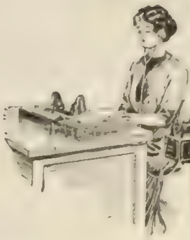
Here's the Whole Story of
The
Dictaphone



Both Ends of It.

YOUR END OF IT—
You start dictating the minute you are **ready** no waiting for anybody. You keep at it steadily or off and on, as you feel like. Full speed or as slow as you want. Correct yourself or repeat as often as you care to. In the meantime your typist is typewriting or doing other work—no part of her time is required for note-taking. If you have much dictation at a time, she has a lot of letters already written before you are through dictating.

YOUR TYPIST'S END OF IT—
She hears your words. She gets what you say; no deciphering shorthand notes of what you said. She does not have to stop and wait every time you stop and think. She controls the dictation she can make you repeat forty times without embarrassment to herself or annoyance to you. She dodges the nerve strain of taking shorthand notes, and the eye strain of "making them out." She gets through her work quicker, easier; writes better letters and more of them—and has time for other work. She writes your letters once, on the typewriter

THE MONEY SIDE OF IT—
You save at least a third on the cost of every letter. Certainly that isn't the least important feature of dictating to the Dictaphone.

Our booklet, "How One Man Saved Money," mailed on request. Write to

GRINDING MACHINES

1 Wilmarth & Morman Universal Tool and Cutter Grinder (new).
2 Wells No. 190 Universal Tool and Cutter Grinder (new).
1 Wilmarth & Morman Style B-X Universal Cutter and Drill Grinder (new).
1 10″ x 36″ Landis Plain Grinder (new).
1 10″ x 20″ Landis Plain Grinder.
2 12″ x 24″ Modern Plain Grinders (nearly new).
1 14″ x 50″ Norton Plain Grinder (nearly new).
2 18″ - 30″ x 96″ Norton Gap Grinders (nearly new).
2 Landis Internal Grinders with No. 75 Heald Heads (nearly new).
1 No. 70 Heald Internal Grinder.
2 No. 60 Heald Cylinder Grinders (nearly new).
1 16″ x 66″ Landis Crank Shaft Grinder (18 months old).
2 14″ Swing Special Internal Grinders, capacity ½″ to 14″ dia. straight or taper.
1 New Yankee, style L, Drill Grinder (new).
1 No. 6M Besley Double Disc Grinder.
1 No. 360 Safety Emery Wheel Ring Wheel Grinder.

TURRET LATHES

58 Potter & Johnson No. 6-A Automatic (new).
8 Potter & Johnson No. 5-A Automatic (nearly new).
12 13″ Gisholt Semi-Automatic (12 mos. old).
20 21″ Gisholt Semi-Automatic (12 mos. old).
5 J & L two spindle (new).
1 J & L 2 x 24 with bar equipment, motor driven (fine condition).

MILLING MACHINES

1 No. 3 Garvin Universal (new).
1 No. 8 Becker Duplex (new).
1 No. 2 Rockford Hand Miller.
3 No. 0 Bristol Hand Millers.
1 Newton Duplex with 72″ table feed.
1 No. 3½ Becker Vertical with Dividing Head.
1 Small Duplex Miller.
1 No. 4 Hendey type Lincoln Miller (nearly new).

DRILLING MACHINES

1 8-spindle Bausch Multiple, 1″ capacity.
1 12″ Spindle Garden ½″ capacity.
6 Barnes 24″ 2-spindle All Gear Drive (new).
1 24″ Hoefer Sliding Head (new).
4 Henry & Wright No. 1 style K (nearly new).
12 Colburn Heavy Duty, size D-2 (new).
27 Colburn Heavy Duty, size D 4 (new).
1 26″ Rockford Sliding Head (fine condition).
3 4 spindle Dwight slate, 14″ swing, ¾″ capacity.
2 Peerless 20″ (new).
1 20″ Mechanics (new).
1 20″ Buffalo (new).
1 28″ Hamilton Sliding Head.
11 Burke No. 1 Bench (new).
1 25″ Kern Sliding Head with Tapping attachment.
362 Paragon High Speed Drills, 1¾″ x 14″ flute, 21″ over all (new).

RADIAL DRILLS

1 36″ Dreses, with quick return tapping attachment (fine condition).

ENGINE LATHES

38 16″ x 8′ Fairbanks-Morse (new).
1 18″ - 36″ x 8′ Fay & Scott Extension Gap (fine condition).
1 30″ x 12′ LeBlond.
1 12″ x 6′ American.
1 28″ x 14′ Fifield.
1 14″ x 4′ Blaisdell.
1 No. 4½ Barnes.
1 54″ x 21′ Detrick & Harvey.
1 26″ x 10′ Bradford.

MARKING MACHINES

2 Noble & Westbrook No. 1 (new).

PROFILERS

1 No. 3H Becker (new).

PLANERS

1 30″ x 30″ x 10′ Ohio with two heads (new).
1 44″ x 44″ x 12′ L W Pond with three heads.
1 40″ x 40″ x 12′ New Haven, with one or two heads.
1 36″ x 36″ x 12′ Sellers widened to 72″.

AUTOMATIC GEAR CUTTERS

1 No. 3 Brown & Sharpe 26″ (old machine).
1 36″ x 4″ Fellows Gear Shaper (fine condition).
1 18″ Schuchart & Schutte Tooth Rounder (nearly new).

CUTTING OFF MACHINES

1 4″ Hurlbut-Rogers Cone Drive (fine condition).
18 Newton No. 500 Gold Saw Machines with 20″ inserted tooth blades (new).

BELT LACING MACHINES

1 12″ Jackson (new).

KEY SEATERS

1 No. 1 Catlin (new).

SCREW MACHINES

1 No. 3 Stecher (new).
1 1″ x 8″ Pierce (new).
3 No. 2 Southworth (nearly new).
4 No. 2 Warner & Swasey, with power feed turret (nearly new).
4 No. 54 1⅜″ capacity National-Acme (used two years).
1 No. 4 B. & O. power feed turret, friction back gears.
1 No. 4½ B. & O., power feed turret, friction back gears.
1 2″ x 24″ Jones & Lamson Motor Driven (fine condition).
1 No. 6 Warner & Swasey 2¼″ capacity back geared but no power feed to turret (nearly new).

BROACHING MACHINES

1 No. 3 La Pointe (nearly new).

BOLT CUTTERS

1 2″ Landis Double Head (nearly new).

BORING AND TURNING MACHINES

1 4′ Bickford Boring & Turning Mill (nearly new).
1 20″ swing 4-Spindle Moline Vertical Boring Machine with 18″ x 36″ table.

BULLDOZERS

1 No. 4 Williams White (old).
1 No. 1 Williams White.

FILING AND SAWING MACHINES

1 Large Filing and Sawing Machine with 12″ stroke.

PUNCHES AND SHEARS

1 No. 3 Walsh Punch Press.
1 Moser 1½″ stroke Punch Press with Automatic Feed.
1 No. 17 Williams White Double End 8″ throat capacity ¼″ x ¼″.
1 27½″ throat lever punch ½″ capacity 1¼″ stroke.
1 Thompson Bevel Shear ½″ capacity.

PIPE MACHINES

1 6″ Saunders.

SHAPERS

1 14″ Hendey Geared Friction.
1 20″ Hendey Geared Friction.

TAPPING MACHINES

1 Garvin No. 1 Automatic (new).
4 Geometric High Speed Tapping Devices, style N (new).
4 Murchey 2″ collapsible taps (new).

THREAD ROLLING MACHINES

1 Waterbury Farrell ⅜″ capacity (nearly new).

THREADING MACHINES

5 Special Threading Machines for threading 3″ steel shells (nearly new).

SPOT WELDERS

1 No. 3 Toledo Type 14-A 220 volts 60 cycles (nearly new).

Write us what you want new or second-hand.

Don't Keep It--Sell It!

If you have a lathe
a drill
a milling machine
a planer
a chain block
a chuck
a motor
a crane
a stock of belting
an engine
a compressor
or any other machine shop equipment for which you really have no further use, why not turn it into *cash?*

Someone may be looking for just the machine you may want to sell. Let us bring you together.

A "classified" ad. in CANADIAN MACHINERY, costing a few cents per issue, has done wonders for others. Why not try it?

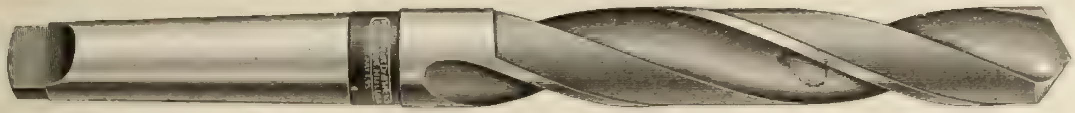
EVIDENCE



IS NOT LACKING THAT

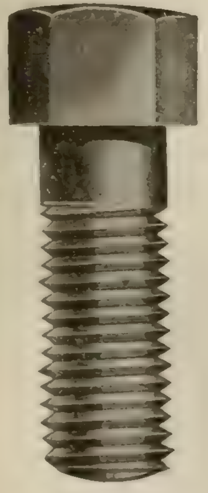
"MORSE" DRILLS

ARE THE DRILLS FOR THE MAN WHO IS LOOKING FOR GOOD WORK AND LOTS OF IT, BUT THE BEST EVIDENCE IS WHAT YOU COLLECT YOURSELF. NOW IS THE TIME FOR YOU TO TEST "MORSE" DRILLS.

MORSE TWIST DRILL & MACHINE COMPANY

NEW BEDFORD MASS., U.S.A.

ACCURACY



The discriminating buyer is the one we like to meet—the one who insists on accurate product. He will eventually buy "GALT" Cap and Set Screws because they measure up to his standard.

Your rush orders for S. F. Hex. nuts taken prompt care of. Better finished nuts—try a sample.

THE
GALT MACHINE SCREW CO.,
LIMITED
GALT, ONTARIO

Eastern Representatives: The Canadian B. K. Morton Company, Limited, 49 Common St., Montreal, Que.

For Rapid Production and Accurate Work

USE THE

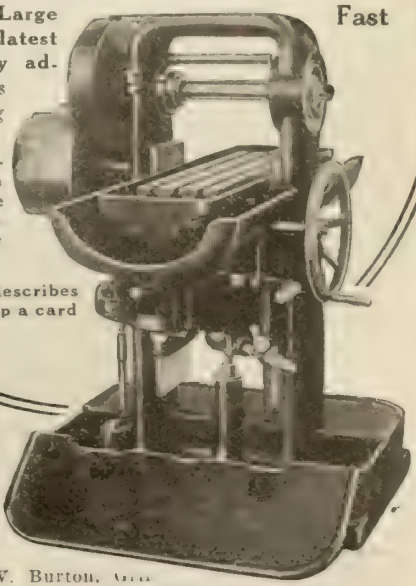
"BRIGGS"

The Briggs Miller handles work no other machine of its size can touch. It is a manufacturing machine. On account of its rigid construction it will produce accurate work when running at a high rate of speed and feed.

Fast

The Base Tank and Large Gear Pump is the latest addition to its many advantages. Tank holds 20 gallons of cutting lubricant.

Pump never requires priming and will deliver ten gallons per minute to the cutters, keeping them cool when run at very high speed.



Our booklet describes fully. Drop a card for it.

Gooley & Edlund
Inc.

FOR VERY DIRTY PLACES

A PROOF OF SINCERITY

We speak in behalf of all manufacturers who have adopted a course identical with ours in dedicating every facility to the service of the old-time customer.

◆ ◆ ◆

In spite of this precaution we have been unable to maintain our prompt delivery service of former days. Perhaps you have taken this to be an indication of insincerity on our part, or a token of our lack of appreciation of your difficulties? Such is far from the case.

◆ ◆ ◆

We understand full well how intense is your need for tools and we are pitting every ounce of our production against the incoming flood of your demand—we are sincere in our desire to serve you—if we were not, we could long ago have accepted a temporary but extraordinarily profitable type of business as a substitute for yours. But we didn't.

◆ ◆ ◆

Shouldn't the mere fact that we chose to forego this extra profit be proof sufficient that we are genuine in our desire to serve you and that we are now doing our level best to supply you at the time and in the quantity you want?

D'Oller Improved Type Chip Centrifugal

For recovering and filtering oil from automatic machined parts, metal chips, turnings, scrap, etc

A large capacity, extremely efficient machine, especially designed and built to care for the "rush" character of work and the increasing volume of shop output now prevailing.

SPECIAL FEATURES

Weston type, self-balancing basket, 30 in. diameter, motor driven.

Bottom chute discharge and conical unloading valve.

Centrifugal oil filter attachment.

The 30" Weston type self-balancing basket, which is the largest capacity for this service, is of the non-removable type. No service (removable) baskets are required for this machine, the load being dumped into the operating basket and discharged by means of our special conical unloading valve and chute, which is a great time-saving feature.

The centrifugal oil filter, with which the machine is equipped, is operated by the main driving belt, the complete unit being therefore self-contained, simultaneously recovering and filtering the oil from the chips, turnings, etc.

We admit

it's hard to avoid blowholes, sand holes, etc., in castings, but it's easy to eliminate these defects with

SHELTON METALLIC FILLER.

SHELTON
METALLIC
FILLER

is used by many of America's Leading Manufacturing Plants.

It has saved many a casting from the scrap heap, and eliminates the necessity of make overs and the consequent expense.

Shelton Metallic Filler becomes part of the casting itself; is durable and can never be detected.

Try it once and you'll use it always.

Motor Driven Speed Lathe

This style of motor drive employs a constant speed motor mounted on a plate having an extension arm to support a bearing for the outer end of the motor shaft. The motor plate is fitted to a slide on a shelf which is securely fastened to the back of the lathe bed. The motor plate is moved by means of a screw which tightens or loosens the belt. A four-step cone pulley on the motor shaft is belted to a four-step cone pulley on the spindle. This gives the same speed variation as when a countershaft is used, and by means of various size cones on the motor a wide range of speeds are obtainable.

The lathe spindle is made from high carbon steel, ground to size, and running in self-oiling bronze bearings. The tailstock has screw and lever feed. The bed is crossed-braced and all clamping levers are above the ways.

J. G. BLOUNT CO. - Everett, Mass., U.S.A.

"Keystone Quality"

This Good Keystone Family

Note the several members as illustrated. Each wrench or ratchet is a special tool for a special purpose.

Each tool represents maximum convenience, speed and economy.

Any better class wholesale house supplies them. Write us for name of nearest dealer.

The Keystone Mfg. Co.,
Buffalo, N.Y.

THE KEYSTONE MFG CO.
WESTCOTT

The Original "WESTCOTT" Adjustable "S" Wrench

HANDLE MALLEABLE IRON, JAW FORGED STEEL.

The "Westcott" Wrench is acknowledged to be the most convenient and useful wrench for general use, and can be used in many places inaccessible to the Monkey Wrench. These wrenches are made of first class material, are strong and durable. The genuine "Westcott" Wrenches have the trade-mark "Westcott" on the handle.

KEYSTONE "Model K" Wrench

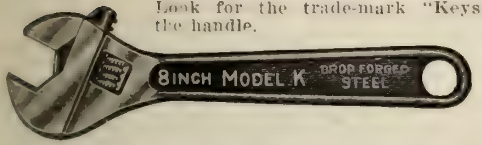
Made in two finishes

All drop-forged steel.

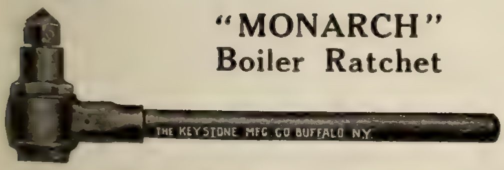
No. 1—Polished all over.

No. 2—Polished Head—Enameled Handle.

Look for the trade-mark "Keystone" on the handle.



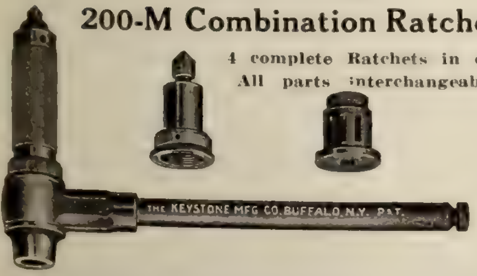
"MONARCH" Boiler Ratchet



For Square Shank Drills Only.
STRONGEST RATCHET MADE.
Fully guaranteed.

"KEYSTONE" 200-M Combination Ratchet

4 complete Ratchets in one.
All parts interchangeable.



Cut Filing Costs in Half

Filing is like drilling. The moment the file wears smooth, it takes twice, or three times the energy to accomplish the desired result. Engineers have got it down to a scientific basis in drilling. The moment a drill reaches its "inefficient point," it is discarded and this "efficient point" is determined by the amount of power used to drill a certain dimension.

Workmen are not machinery; consequently you have to depend upon the personal element and educate your men up to the point where they will know at once when their files have reached the "inefficient point." If you can educate your men to do this you will get double the results at the bench, compared by results when men have been working with files that are inefficient.

KEARNEY & FOOT
GREAT WESTERN
AMERICAN
ARCADE
GLOBE

(MADE IN CANADA)

Write for our booklet "File Filosophy." It is well worth reading by any manufacturer, shop superintendent, shop foreman or workman who is concerned with the use of files.

SILENT CHAIN DRIVE WITH GUARD FOR FEEDS
COMPRESSION GREASE CUP FOR CHAIN

Hendey Millers will take any kind of a miller jo

that comes into the modern sho

and it delivers the finished work in the highest degree of accuracy and perfection. It has a wide range of spindle speeds (16) and feeds (18).

The "**Hendey**" is free from the usual complicated features. All working positions are secured with but **few and easily understood movements** on the part of the operator. **Anyone can operate the "Hendey Miller."** No special skill is required to get the service that the Hendey's built for.

Write for the "Hendey Miller" Book. It is certain to interest you.

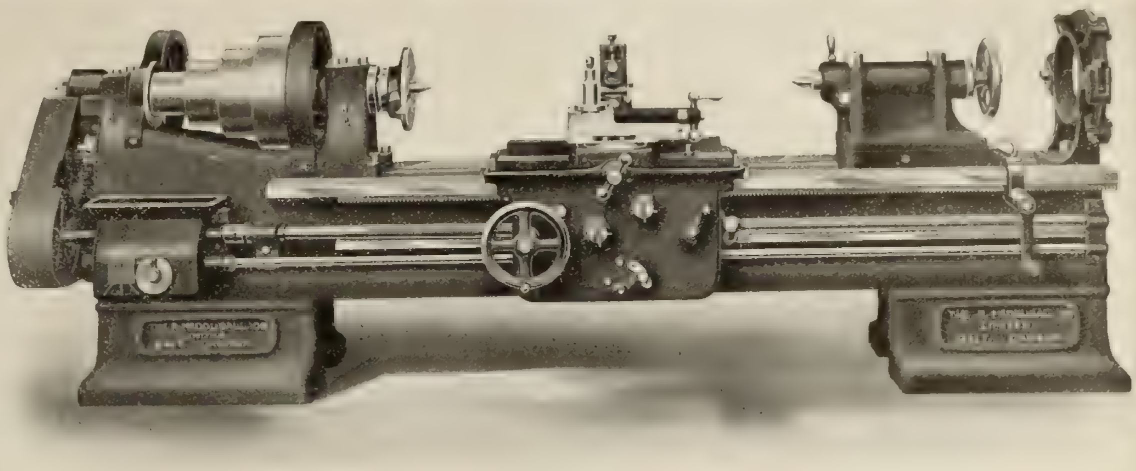
McDougall Lathes for Big Production

16, 18, 20, 22 and 26 inch Swing.



Big Shells require Lathes which are built to stand the strain of high speed production.

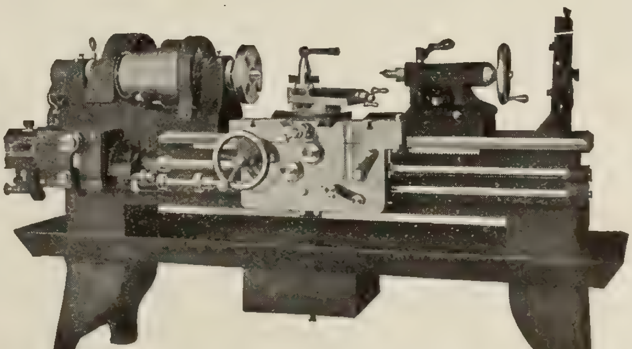
McDOUGALL Lathes are built right and of the best materials. They will easily handle any thing up to the limits of their rated capacity.

Furnished with all the regular attachments of modern machine tool practice.

ARE-MAC-DEE IS A GUARANTEE

The R. McDougall Company, Limited
Manufacturers
GALT, Ont., Canada
The Canadian Fairbanks-Morse Co., Limited, Sales Agents.

In Stock for Immediate Delivery



1 20 x 8 Foster Geared Friction Head Turret Lathe.
2 17 x 8 Sidney Quick Change Gear Lathes.
2 14 x 6 Monarch Standard Geared Engine Lathes.
1 8" Rivett Bench Lathe, power feed, draw-in collets, grinding and milling attachment.
2 16 x 8 South Bend Screw Cutting Lathes.
1 18½ x 8 Cincinnati Quick Change Gear Lathe, double back-gear, double plate apron.
[illegible] 18 x 8 Mueller Lathes, three-step cone, double back-geared.
1 22 x 10 Milwaukee Semi-Quick Change Gear Lathe, double back gear and compound rest.
1 20 x 8 Walcott Lathe, quick-change gear, three-step cone, double back-gear.
1 24 x 8 National Quick Change Gear Lathe.
1 18 x 14 Boye & Emmes Lathe, quick-change gear, double back apron, double plate apron.

1 16" Sipp Quick Change Speed Sensitive Drill Press.
1 20" Lindgren Plain All Geared Drill Press.
1 26" Sibley Back-Geared, Sliding Head Drill Press
1 20" Buffalo Drill Press, worm and lever feed.
2 14" 4-spindle Drill Presses (Sensitive).
3 14" 3-spindle Drill Presses (Sensitive).
4 12" Single Spindle Drill Presses (Sensitive).
1 No. 2 Garvin Universal Milling Machine.
1 24 x 24 x 6 London Planer.
1 16" Ohio Std. Duty B.G. Shaper.
1 20" Smith & Mills B.G. Crank Shaper.
1—20" Kelley B.G. Crank Shaper.
1 24" Kelley B.G. Crank Shaper.
1 12" Smith & Mills Crank Shaper.
1 28" Smith & Mills Crank Shaper.
1 No. 2 Diamond Surface Grinder, 36" x 12" x 9".

C.M.C. C.M.C.

Registered Trade - Mark of the Canada Machinery Corporation, Ltd

C.M.C.

The Mark of Distinction in Machine Tools

Best material, highest grade workmanship with modern designs and many years' experience make our tools recognized for their excellence. C. M. C. on machine tools means a Cut in Machining Costs.

See our new 14" Engine Lathe on exhibition in Machinery Hall at the Canadian National Exhibition, Toronto, Ont.

For convenience of the trade we have opened Showrooms in Toronto at Brock Avenue Subway, where a full line of our Machinery can be inspected.

CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by The MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

Vol. XVI—No. 10 Publication Office: Toronto, Sept. 7, 1916 Subscription Price $3.00 per Year

Cut Filing Costs in Half

FILING is like drilling. The moment the file wears smooth, it takes twice, or three times, the energy to accomplish the desired result. Engineers have got it down to a scientific basis in drilling. The moment a drill reaches its "inefficient point" it is discarded and this "efficient point" is determined by the amount of power used to drill a certain dimension.

Workmen are not machinery; consequently you have to depend upon the personal element and educate your men up to the point where they will know at once when their files have reached the "inefficient point." If you can educate your men to do this you will get double the results at the bench, compared by results when men have been working with files that are inefficient.

The Famous Five are:

KEARNEY & FOOT
GREAT WESTERN
AMERICAN ARCADE GLOBE
(MADE IN CANADA)

Write for our booklet "File Filosophy." It is well worth reading by any manufacturer, shop superintendent, shop foreman or workman who is concerned with the use of files.

Nicholson File Company

Parts of P. & W. Solid Adjustable Blade Reamers

USE P. & W. SOLID ADJUSTABLE BLADE REAMERS

Unexcelled for Design, Simplicity and Ease of Adjustment.

1. The eccentrically relieved blades are stronger than others, do not chatter and produce a smoother hole.

2. The hand, shell and fluted chucking reamers have interchangeable nuts, screws and wrenches.

3. The bottom of a hole can readily be faced.

4. By a simple adjustment of the blades the reamer can easily be set to size without regrinding.

REDUCE YOUR REAMING COSTS

Canada's Growing Trade

Despite the fact that Canada has raised and is maintaining a very respectable sized army, drawn from the very best of her manhood, and largely from the ranks of labor, her trade is increasing at an enormous rate.

* * *

The following statement prepared by the Minister of Customs, Ottawa, will, we believe, prove as illuminating to our readers abroad as it did to many at home when it appeared in the daily press two weeks ago.

* * *

Ottawa, Aug. 23.—The aggregate trade of Canada in four months has increased by more than 100 per cent.

The July trade as shown in the monthly summary issued to-day by the Hon. J. D. Reid, minister of customs, showed the phenomenal rise of 141 per cent., or $139,860,450. The total trade for the month amounted to $238,860,488, and for the four months ending July 31 it reached the total of $766,372,832, as against $371,646,906 in the corresponding period of last year.

* * *

The statement shows that both exports and imports have contributed to the aggregate increase, *with the larger figures in the export column.* Imports for consumption amounted in value to $63,622,587 in July as compared with $36,622,190 in July last year, while in the four months period they rose from $134,729,377 to $249,867,767. *The July exports reached a value of* $104,964,270 *compared with* $45,590,038.

* * *

In the four months the exports have risen from $159,168,259 to $350,345,305. These are the figures for domestic imports and exports only. In the movement of coin and bullion there has been a sharp decline as regards imports and, for the four months, of exports also, although the gold exports last month were slightly larger than in the same month of 1915.

* * *

In the export of foreign merchandise there has been a notable increase, nearly one thousand per cent. The volume of these exports rose from $11,494,457 in the four months of last year to $122,627,072 in the same period this year. In the month of July they jumped from $2,916,682 to $55,637,340.

* * *

An interesting feature of the statement is the substantial rise in the imports of free goods; there has been, however, a corresponding increase in the imports of dutiable merchandise, and the duty collected in the four months has risen from $28,085,471 to $46,063,507.

* * *

The detailed statement of exports shows that the shipments of Canadian manufactured products trebled in July, amounting to $38,264,136, while the exports of farm products amounted to $38,585,309, or five times the total of July last year. Exports of foreign mine products, which were less than a million in July last year, reached a total of over fifty-four millions last month.

* * *

Of course it will not be forgotten that a large proportion of our exports consisted of munitions and war supplies, although the more peaceful lines of manufacture undoubtedly showed up well in the increase.

* * *

The very fact that our manufacturers are able to produce munitions, and other war supplies, in compliance with the exacting requirements of the military authorities speaks volumes for their ability to satisfactorily handle export business of a purely commercial nature.

* * *

Canadian manufacturers are alive to their opportunities, but while quick to take advantage of same, they are developing an export trade along lines which will lead to permanency.

* * *

Our July trade statement will not only tend to inspire even greater confidence in Canada and Canadian goods, but will encourage Canadian manufacturers to redouble their efforts in extending their connections abroad.

* * *

This is the fourth Export Number of Canadian Machinery. The next will be published October 4th, and as usual a large number of copies will be distributed in Allied and Neutral Countries.

One of the types of Crawford Sectional Ovens used by Manufacturers for Baking the Varnish or Protection Finish on Shrapnel and High Explosive Shells.

These ovens are equipped with the only gas burner that gives a combined radiated heat and circulation of preheated air in the oven.

The gas and air are mixed and combustion in the large cylinder supported by air from a positive pressure blower which gives the highest efficiency and economy known for burning either city, natural, gasoline or producer gas, and there is no exposed flame in the oven.

The truck shown, holds (120) twenty-eight-pound shells and is planned to stand the shells on end, resting on angles. Other designs have been built for shells ranging in weight from fifteen to eight hundred pounds, the last mentioned shell being forty-eight inches high by twelve inches in diameter.

THE IRON AGE

—and they certainly get results

If we mentioned the name, you'd agree with us without the slightest hesitation. For this picture of a Gilbert & Barker installation was taken in the plant of an automobile manufacturer whose name is known wherever gasoline is burned, a manufacturer who makes one of the most expensive as well as one of the best cars built in America.

Only the best will do in this plant, the best of materials and the best means and methods of finishing them. They want results, they must have results—and they get them

Gilbert & Barker Furnaces are a big help in maintaining the established standards in the various heat treating processes. They're a big help in keeping down the cost, too.

Write for Catalog No. 23. You'll find it interesting.

STELLITE

A NEW EPOCH IN CUTTING METALS

Stellite is so far superior to all other cutting metals that there is no comparison between them. It's use marks a new epoch in cutting metals where speed and endurance counts.

Stellite contains no iron or steel, but it will do from 20 to 100 per cent. more work than the best High-Speed Steel.

Stellite will take **bigger cuts** at a **higher speed** than is possible with any tool steel.

Stellite is a **money saver.**

Finishing Both Ends At Once!

MALLEABLE IRON TURNBUCKLES:

Production:
300 Pieces Per Hour

Labor Cost:
1 c Per 100 Pieces

Operations: Drill, Ream and Tap

THE supremacy of the "NEW BRITAIN" for this class of work is evident.

ORDINARY methods of handling this piece would require two settings and six consecutive operations.

THE "NEW BRITAIN" way requires but one setting, all six operations being completed simultaneously.

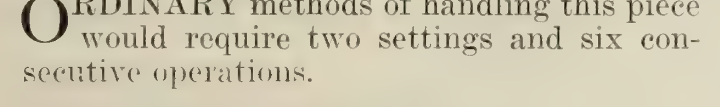
RESULT—8 to 10 times greater production!

Are you curious to know how much a "New Britain" would increase your production? Send us your blueprints for guaranteed estimates.

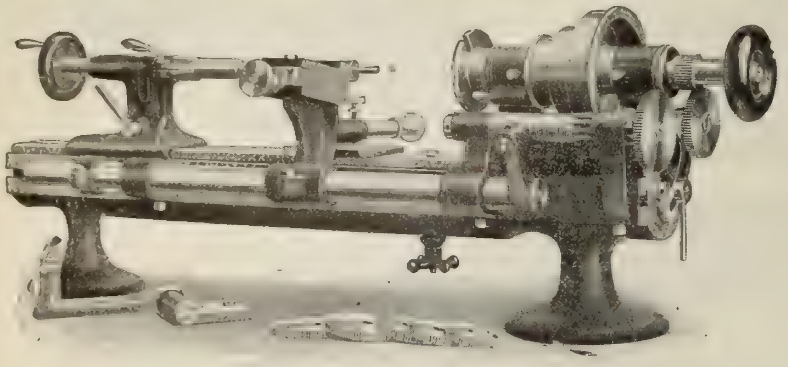
The New Britain Machine Co.

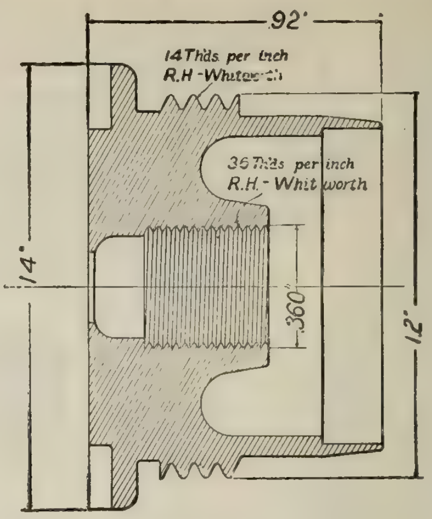
—Automatic Screw and Chucking Machines—

New Britain, Conn., U.S.A.



THE CATARACT BENCH LATHE WITH CHASING ATTACHMENTS





We have sold many of our lathes to Canadian concerns who are eminently satisfied with results. Will you be next?

For work requiring greatest accuracy and rapidity, THE HARDINGE CATARACT BENCH LATHE will not disappoint you. Machine equipped with Automatic Chuck Closer for rapid operation of chuck, and with chasing bar arranged with multiple point, chasing tool is producing from ten to twelve hundred 14-pitch Whitworth threads on primers in TEN HOURS. Prompt deliveries. Catalogue No. 15 is ready to mail TO YOU. You are invited to write for it to-day.

HARDINGE BROTHERS, Inc., 1770 Bertau Ave., CHICAGO, U.S.A.

How Lathe Simplicity Solves Labor Problems

The great simplicity, the compact, convenient design, make the Hercules Lathe an ideal single-purpose machine. To train an unskilled laborer to perform accurately one or two operations on this machine requires but a short time. The rugged, powerful construction then enables that laborer to turn out precise work continuously at the maximum speed.

Where skilled mechanics are not always available — the Hercules Single-Purpose Lathe is the logical machine tool.

At the present time, we can still make early deliveries. Write — at once—for full details.

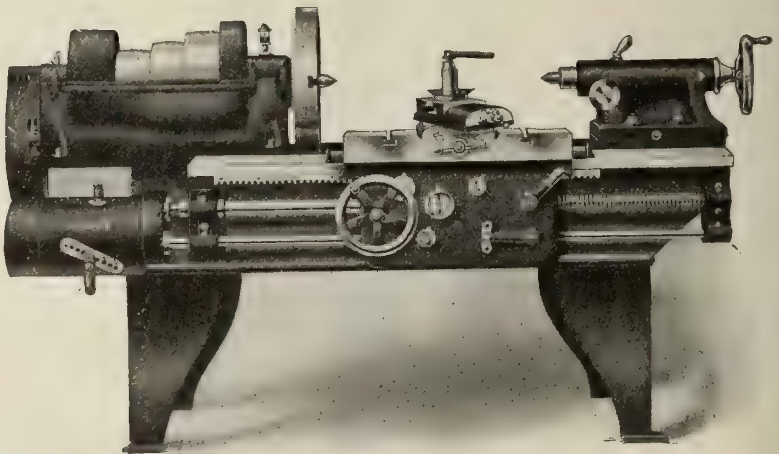
SIDNEY ENGINE LATHE

A "Heavy Turning" Tool of Wonderful Accuracy



17-inch and 19-inch plain change engine lathe, all double back geared. Built 8, 10 and 12-foot lengths of bed.

Some of the important features

20 per cent. steel mixture in bed casting. Heavy carriage vee 2½ inches wide.

High carbon rack pinned and bolted to bed.

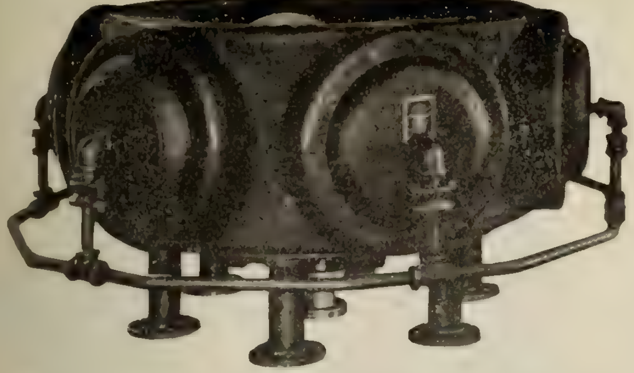
50-point carbon steel head stock spindle offset 1 inch off centres for heavy duty work.

40-point carbon lead screw 17-16 inch diameter, 2 pitch thread.

Let us tell you of the many other interesting details. Write for full particulars.

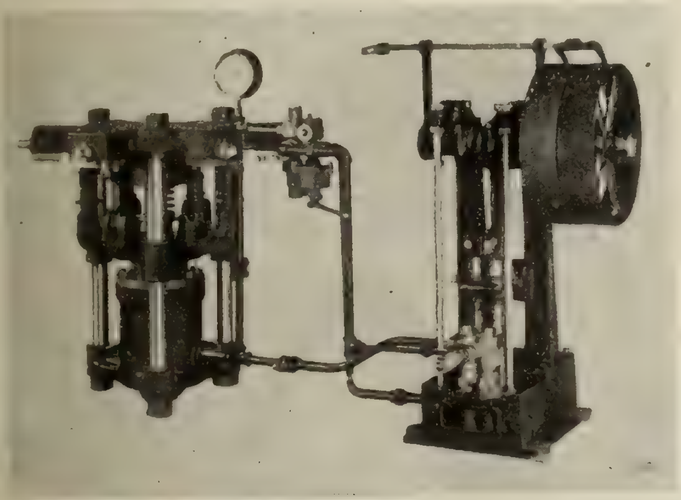
THE SIDNEY TOOL COMPANY, Sidney, Ohio, U.S.A.

Canadian Agents: ONTARIO: The A. R. Williams Machinery Co., Toronto; QUEBEC: The Foss & Hill Machinery Co.,



Capacity, 6 to 12-in. Shells

Capacity, 6 to 12″ shells—950 ton at 3,500 maximum pressure.
Rams—6—Semi-steel, 11″ diameter. Have bearings 9″ long. “U” packed. Chrome leather packing. Move of each ram ½″ or more if necessary.
All rams returned by means of levers on plate with heavy Vanadium steel spring, adjustable for tension.
Cylinder—Removable, of alloy steel. Hydraulic inlet to cylinder, 1¼″ pipe.
Distributing ring, 2″.
All pipe, seamles steel tubing; all fittings, drop forged steel.
All parts of press under stress or strain, alloy steel castings or forgings.
Dies, 6, of forged chrome nickel steel hardened, and removable without disturbing any part of press by loosening 2 nuts.
Weight: 9,500 lbs.
Can be operated either from accumulator or pump.



“Metalwood” Horizontal Banding Press for Shells from 3 to 6 in.

Press is combination Hydraulic and toggle with means of adjustment both for amount of pressure applied and stroke. Has six concentric dies coming to a common centre forming a complete circle when closed to required diameter of band.
All working parts are fully enclosed, at the same time easily accessible for changing of dies. Toggles are arranged with adjustment so that pressure delivered on dies can be varied to suit the pressure or pressures applied on hydraulic cylinder. 2,500 lb. approximate pressure required, developing 120 tons on 9″ ram.
Press driven with “METALWOOD” VERTICAL DUPLEX PUMP, or accumulator driven, giving capacity of 20 strokes per minute. Press throughout is made of steel. Pump has all bearings Phosphor Bronze lined.
Press and Pump Controlled by “METALWOOD” Patent Single Lever Valve which controls pressure applied and return of ram.
Weight of press is 2,450 lbs. Weight of pump is 1,200 lbs.

Metalwood Banding Presses

A BOON TO SHELL MAKING

While the price of the press in the above illustration is somewhat higher than other banding presses on the market, customers who have used both unhesitatingly prefer our machine, even to the point of discarding other types, for the reason that it is so sturdily constructed in every respect, that it withstands the most severe service and constant use, therefore the price becomes a secondary consideration.

The “Metalwood” Horizontal Banding Press (see bottom illustration) is a **very rapid worker**; in fact the operation of this press is so rapid that it is impossible for human operators to handle the work to and from as quickly as it completes its operations. It is impossible to utilize its full capacity.

We have a number of these presses that have been in hard service for many months past, and up to the present we have not as yet been called upon to supply a single repair part, even packings.

Drop a line for full particulars.

Cranes of All Types

One Paragraph From A Machinery Dealer's Letter:-

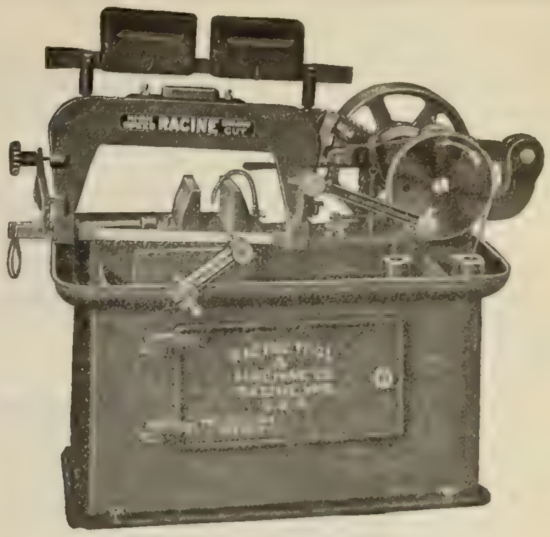
PEERLESS
PEERLESS MACHINE CO. RACINE, WIS.

"One of our customers has recently purchased from us two of your 6" PEERLESS High Speed Power Hack Saws, and they now wish to install several more, providing we can take some of their old hack saws in exchange. They claim these old machines are as good as new, but they consider the PEERLESS so far superior to the others that they would like to fully equip their factory with PEERLESS Machines."

The principle of construction in the PEERLESS High Speed Heavy Duty Cutting-off Machine admits of a cutting speed which cannot be approached by the ordinary type of machine. The output of this machine is controlled by the efficiency of the blade. At the maximum speed which this machine is guaranteed to operate it cuts off a 3 in. round cold rolled bar in 1½ minutes.

Bearings are extra large. The ones that are subject to excessive wear are made of steel, hardened and ground, which eliminates the continuous adjusting and repairing that ordinarily is the case when a machine is worked to its utmost.

PEERLESS MACHINE COMPANY
1607 Racine Street RACINE, WISCONSIN



WHY IS IT

That so many Canadian shops are now equipped and being equipped with

The Newly Improved Racine High Speed, Metal-Cutting Machine?

FOR MANY GOOD REASONS—among others—because for speed, accuracy, economy and ease of operation THE RACINE cannot be surpassed. You MAY NEED ONE NOW. We will send a RACINE on any trial basis that is fair. WRITE US or any good Canadian dealer.

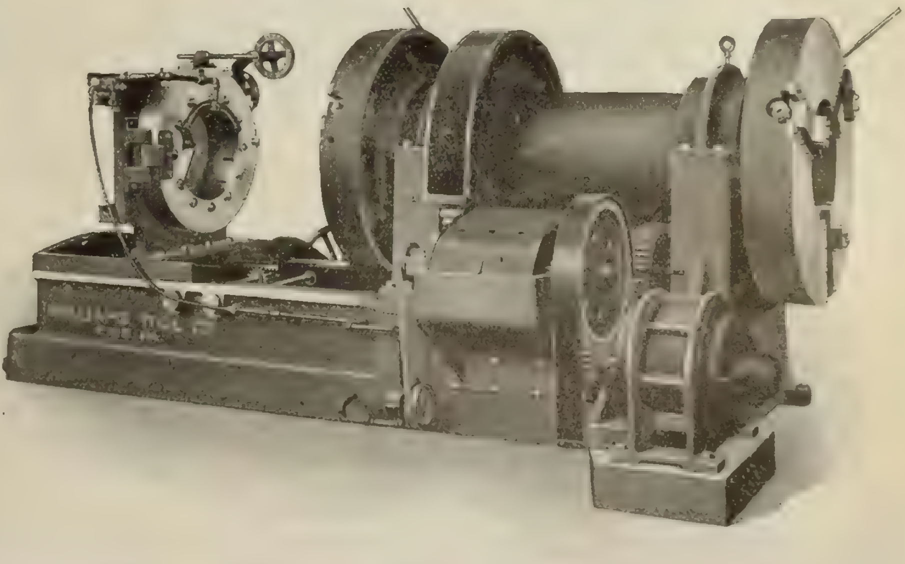
WILLIAMS PIPE MACHINES

Received Highest Award at Panama Exposition



The Following Letter Explains Why:

Williams Tool Co., Erie, Pa.: Rochester, N.Y., 12-3-14.

Gentlemen:—We are so pleased with our No. 3 Pipe Machine, and it is doing such splendid work for us at a minimum of expense that we are now considering the advisability of displacing two smaller machines for one of your No. 1½ or No. 2 motor drive.

The machines which we would displace, if we make a change, are belt drive, are (names of two of the oldest and best known machines on the market) equipped with nipple holders, extra dies, etc. Both of these machines are still in fairly good condition. On what basis could we make an exchange with you?

Yours very truly, SAMUEL SLOAN & CO.

WILLIAMS TOOL CO. - - - ERIE, PA.

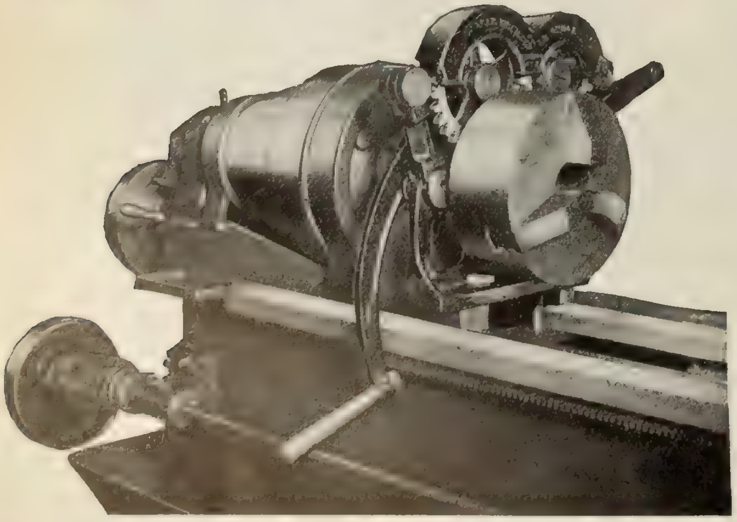
Speed Up! Production
With a Barker Wrenchless Chuck



You don't consider money spent, on something which will bring returns—it is invested.

A chuck which will cut the time of setting-up in half and at the same time not be prohibitive in initial cost or maintenance is a most worth-while investment in your plant —is it not?

Barker Wrenchless Chucks are proving their worth as a investment in many plants where multiple chucking ha been a profitless bugaboo—perhaps your neighbor is Barker fan—let us send you a list of users in your territory.

An inquiry to-day will bring the Barker proposition to yo by return mail. You can't go wrong and you do not obligate yourself in any way whatsoever.

The entire opening and closing operation is accomplished with a short action of the hand lever— think what this means in saving of time.

No Dead Space on This Magnetic Chuck

In examining the faces of the other types of magnetic chuck you are struck at the large amount of dead space resulting from the arrangement of the poles. But with the

HEALD MAGNETIC CHUCK

you see there is practically no *dead space,* due to the ingenious arrangement of poles. A further advantage is that either small or large work can be handled without change of face plate. The pull is *uniform* over the entire chuck, and the holding power is so great that very heavy cuts can readily be taken.

There are a dozen other advantages in this chuck we shall be glad to explain upon request. Write for full information.

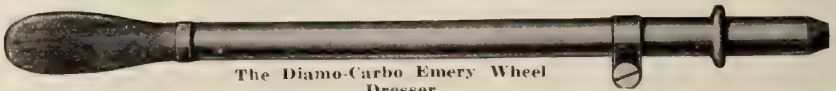
GRINDING WHEEL DRESSERS

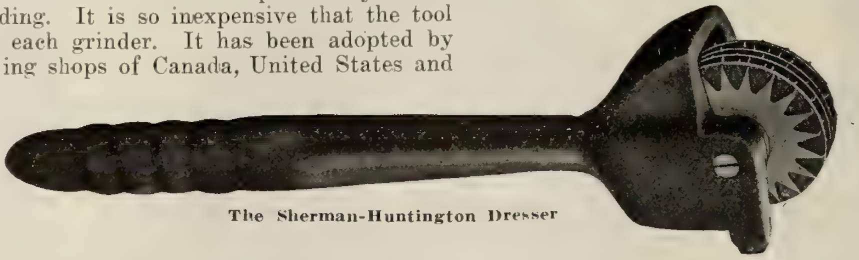
No one type of Grinding Wheel Dresser is adapted for all kinds of wheels, any more than one size or grade of wheel is adapted for all classes of work. We manufacture Dressers for every class of wheel, and, being specialists, are frequently in position to make valuable suggestions to customers as to the best type of Dresser for their particular needs.

Any of our Dressers will be cheerfully sent, subject to approval and can be returned should they not be found satisfactory.



The Diamo-Carbo Emery Wheel Dresser

Owing to the high price of Diamond Dressers, the Diamo-Carbo is rapidly coming into favor as an economical substitute for the Diamond. It will do practically the same work as will the Diamond, excepting in some instances of precision grinding. It is so inexpensive that the tool can be left with each grinder. It has been adopted by many of the leading shops of Canada, United States and Great Britain.



The Sherman-Huntington Dresser

For rough work the Huntington Dresser mounted on the bearings covered by our Sherman patent give the best results. They are made in two sizes: No. 1 with Cutters 1¼" diameter and No. 2 with cutters 2⅜" diameter. We also make the ordinary Huntington Cutters. All of our Dressers of this type are equipped with our protection hood which continually protects the face of the user from flying particles and is a very valuable feature at no added cost.

If You are Grinding Malleables, You Should Read This Announcement of the Improved Aloxite Wheel

WE have produced the Improved Aloxite Wheel to fill the need of a wheel to give *real* service in the grinding of malleables. We have produced this special wheel to help you to greater production at a lessened grinding cost. ¶ The Improved Aloxite Wheel is the result of long experiment and experience. ¶ We wanted to give you a wheel that would cut cleaner and faster—a wheel that would show much greater durability than any wheel you have ever had for the grinding of malleables. ¶ The results of exhaustive tests in many plants under varied grinding conditions have proven that the Improved Aloxite Wheel for malleables is the wheel that was wanted—*The Right Wheel in the Right Place.* ¶ It's a faster cutting wheel—a cleaner, freer cutting wheel that will stand up under the trying conditions—a wheel that will hold its shape, and require less dressing—an infinitely better wheel than we have ever produced for this class of work.

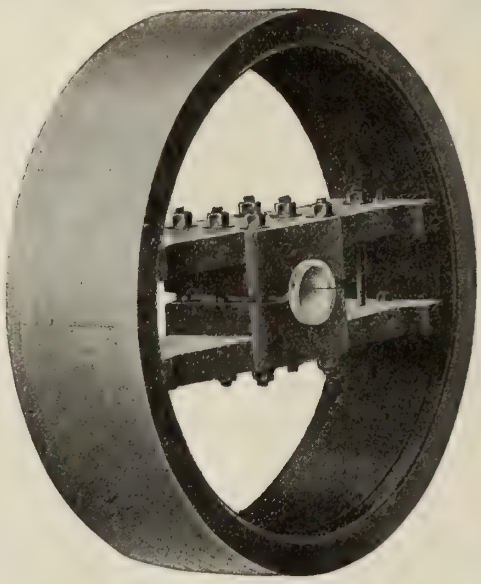
PULLEYS

No Keys

No Set Screws

In Perfect Balance



Lighter

Stronger

Better Belt Surface

The Dodge Standard Wood Split Pulley

The Wood Split Pulley is better than either cast iron split pulleys or steel split pulleys for the following reasons—

The wood pulley is lighter, stronger, better balanced, and provides a very much better belt surface. It costs 33 1-3% less money and provides 50% more returns in horse-power value. It may be run at very much higher speeds with no danger of bursting—also it may be had quicker and in a greater range of sizes.

It costs less to get—less to put on—and less to keep.

We make approximately 300 Dodge pulleys every day—everybody uses them.

There are more Dodge pulleys making ammunition than any other kind—you can get them quick.

Every pulley is thoroughly nailed. Every pulley is guaranteed for Double Belts.

We are Canada's greatest pulley makers.

If you have not our Books, write us.

4,000 TON STEAM HYDRAULIC FORGING PRESS FOR MARINE AND OTHER HEAVY FORGINGS.

The product of a modern steam-hydraulic press is denser and more homogeneous than can be obtained with the steam hammer, due to the effect of the blow of the latter not penetrating to the centre, in contradistinction to the uniform kneeding effect of the press; while the amount of work that can be done by the latter at one time with little variation in temperature, strongly tends towards a better product. The greater uniformity and reliability of steam hydraulic forgings make their use imperative wherever high-class products are required.

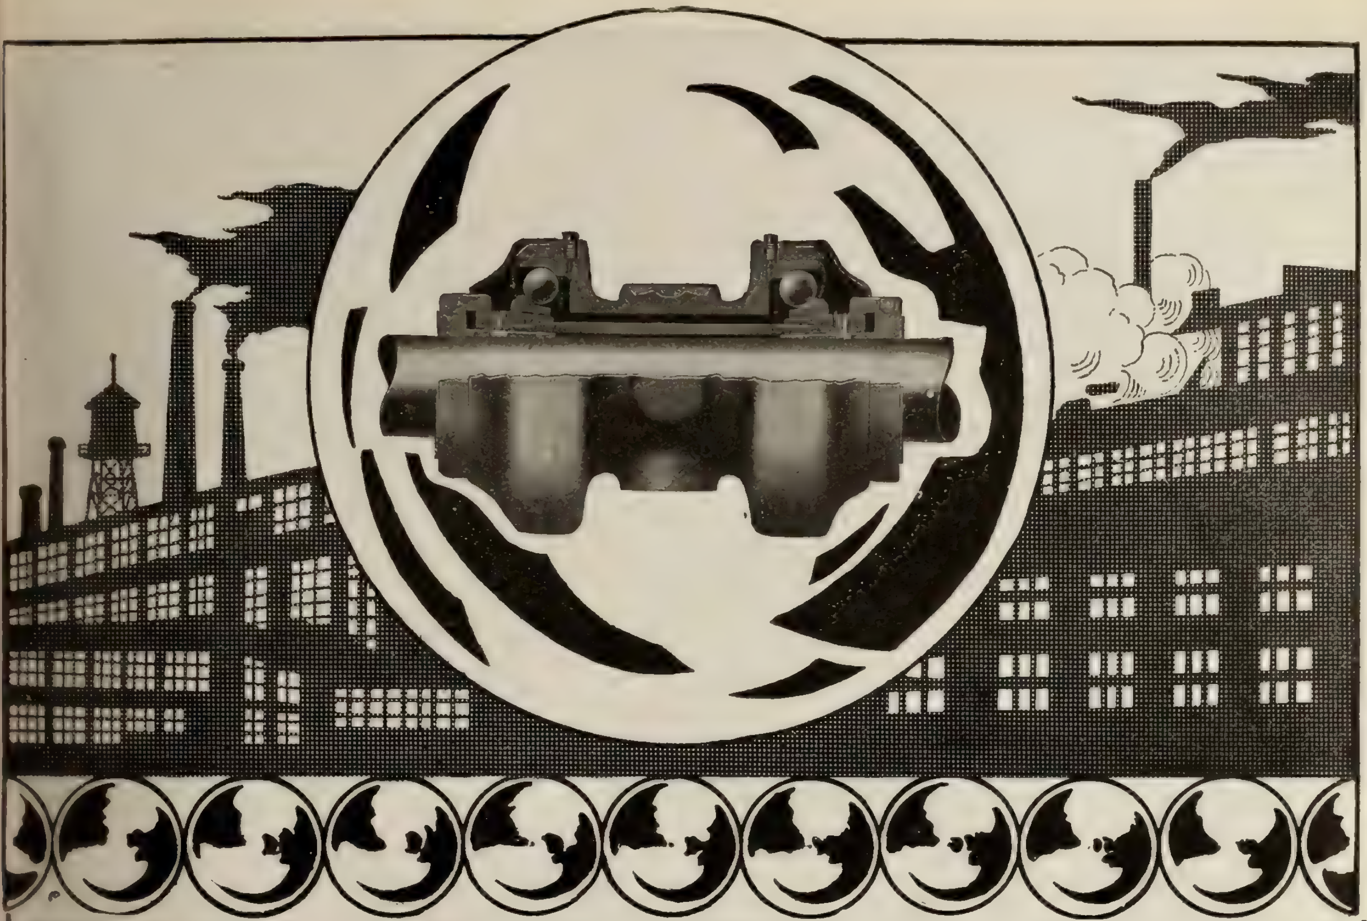
75-TON CAR BELONGING TO AN ORDER RECENTLY COMPLETED FOR 2,000 CARS FROM THE IMPERIAL RUSSIAN GOVERNMENT.

FREIGHT CARS TO ALL GAUGES

The Russian type car illustrated is exceptionally large, resembling the C. P. R. Type box car. It is unusually long—43 ft., and has a carrying capacity of 40 tons of grain. The track gauge is 5 ft., being $3\frac{1}{2}$ inches wider than Canadian railroad standard. The wheels are of cast iron, $41\frac{3}{8}$ inches in diameter. Steel frame construction is employed throughout. The design provides for "knock-down" shipment.

Eastern Car Co., Limited NEW GLASGOW, N.S.



Run your plant on

Chapman Double Ball Bearings

YOU'LL SAVE POWER

The ordinary line of shafting consumes and wastes from 15 to 60% of power developed.

But the line shafting that's equipped with Chapman Double Ball Bearings will save 75% of the friction loads, making an average total saving of power from 15% to 30%.

Chapman Double Ball Bearings will greatly reduce your power cost or if you are in need of more power they will give it to you at the present cost. They often eliminate the necssity of increasing the size of the power plant.

Oiling and attention are reduced to a minimum. Lubrication is only required twice a year.

Chapman Double Ball Bearings fit any adjustable hanger, and the change can be made with but little delay to you.

Used in over 2,000 Canadian Factories.

Write for full particulars.

CONTINUOUS SERVICE

To-day the aim of every manufacturer is to attain Uninterrupted Production. Maintenance of this Production is possible only through continuity of operation, and Transmission of Power is a prime factor in rendering Continuous Service.

In Great Beehives of Industry and in the smallest and most Remote Mills, G & K Belting is used as the means to Uninterrupted Production. Drives which were a constant source of trouble are now highly productive,—saving loss of time and cost of replacement,—increasing output and lowering unit cost.

You, too, will find that G & K Belting is more than just good belting, that it incorporates the quality, strength, pliability, and firmness, so essential to the day-in and day-out efficient transmission of power. You will find a brand for every drive, every condition of service,—you will find the belt especially suited to your requirements.

Catalog, Samples, Engineering Advice, and complete details furnished cheerfully upon request. May we assist you toward Continuous Belting Service?

"FULFLO"
MACHINE TOOL
Lubricant
PUMP

You can drive your machines faster

but your cutting tools won't stand it — the speed burns them up.

A cutting tool will stand up to higher speed and heavier feeds, providing it is kept cool.

The "FULFLO" Machine Tool Lubricant Pump supplies a good "HEAVY" stream of compound sufficient to carry away all the heat.

No gears or other close-fitting parts to be affected by the grit, dirt, or small chips that are always present in the coolant. No clogging.

The only working part is the impellor. Since no check valve, reverse valve or any other kind of valve is present in the pump or pipe, other than the stop cock, the usual valve troubles are eliminated.

Easily attached to any machine. **Insist that the new machines you buy be equipped with the "FULFLO."**

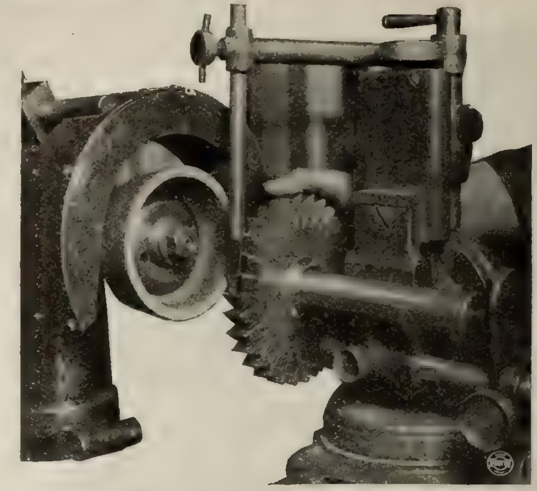
The Grip is almost Gearlike

Several years ago we designed this pulley for main belt drives because a *gearlike* grip was necessary.

The cork insets guarantee just that extra adhesion which removes the risk from that "one time in a thousand" when other pulleys *might* slip.

We have some extremely enlightening data on the differences between ordinary "Americans" and our Steel Split Cork Inset Pulleys on main drives. This information is of vital importance to every manufacturer. We will gladly give it to you if you will address any one of the offices above.



Set-up for Grinding Side Mill

Alundum in the Tool Room

One of the most popular wheels for grinding gear cutters is Alundum 3846 K, although 3850 J is a strong contender for first place. In the smaller wheels 3860 K is very satisfactory.

The wheel most commonly furnished for grinding inserted tooth milling cutters is 3846 grades J and K. Under certain conditions it has been found necessary to use a little coarser wheel, 3836 and a grade as soft as I.

Form cutters are usually ground with a saucer or dish wheel and the grain and grade in greatest demand is Alundum 3860, J and K.

It is a common fault to use a wheel that is too fine. For most classes of cutter grinding a medium coarse wheel about grain 46, never finer than 60, is best suited for both high-speed and carbon steel. The finer wheels are more likely to burn the work than the coarser.

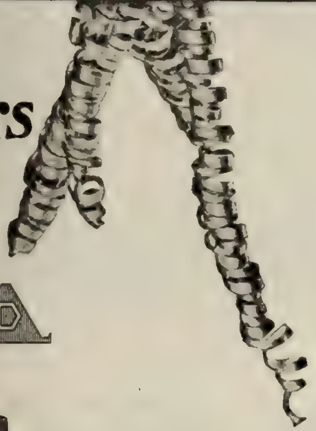
The Tap that Wears Out Before it Breaks

It Shears



The G.T.D. "Gun" Tap

A brief summary of some of the qualifications of the "Gun" tap explains in part the sudden success and popularity of this remarkable tool.

The "Gun" tap is made of special tap steel—assuring uniformity in hardness, cutting size and lead.

It cuts true to size in any and all materials.

It shears and cuts instead of scraping, requiring 1-3 to 1-2 less cutting power.

All the cutting is done on the point—the cleanly cut, accurate threads are not marred by the balance of the threaded section.

Higher cutting speeds are practical—giving greater production.

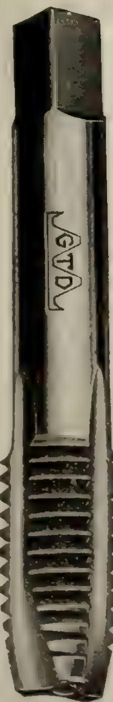
Method of regrinding insures long life and maintenance of cutting size.

Chips do not accumulate and clog in the flutes.

There is as much metal in the threaded section as in the shank.

These combinations of material, principles of design, strength and ease of cutting, makes possible **THE TAP THAT WEARS OUT BEFORE IT BREAKS** saving 90% of your tap bills besides giving you greater production and higher quality of work.

Send us your blue prints or samples of work on your tapping proposition. We will go over the work carefully and suggest the right tap, cutting speed, lubricant, size of drill hole, etc., for best results.



"Gun" Tap—

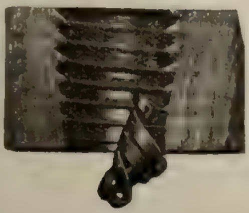
Works in just this way—the chips are sheared out and forced ahead of the tap.

All the cutting is done on the first few teeth—the balance of the threaded section acts as a lead screw.

The deflecting of the chips prevents the chips collecting in the flutes of the tap and does away with binding, cutting over size, and breaking.

The small cut below shows a section of threaded hole tapped with the "Gun" tap.

Note the angle at which the chips are cut—this explains the deflecting action which throws the chips ahead of the tap.



CLIP THIS CORNER NOW — and get the new bulletin that goes into detail—shows results of tests, etc.

HEAVY SHELL LATHES

Limited Quantity for Immediate Delivery

These lathes are particularly adapted for the minor operations on all large shells, and all operations on smaller shells up to 5 in., with the application of various attachments, which we can supply. Ideal machines for rough and finish turning.

Greater efficiency and speed will be secured by the use of machines adapted for each particular operation.

These machines as now manufactured embody many improvements over the first lot of lathes made.

Full Specifications on application.

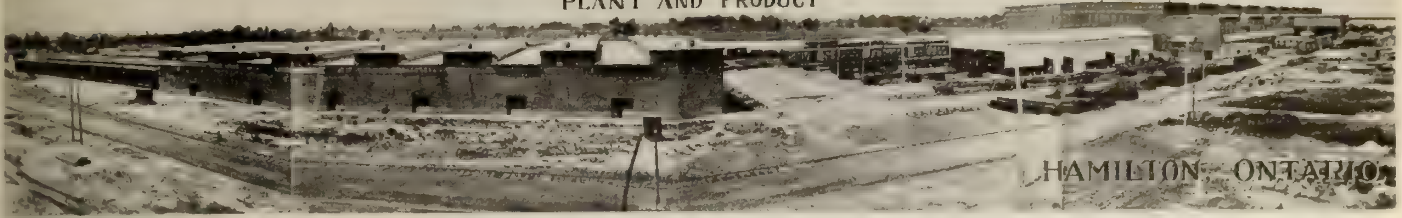
CANADA'S DEPARTMENTAL HOUSE FOR MECHANICAL GOODS

THE NATIONAL STEEL CAR COMPANY LIMITED

PLANT AND PRODUCT



PANORAMIC VIEW OF CAR SHOPS AT HAMILTON INDICATING EXTENT OF GROUND OCCUPIED AND LAYOUT OF BUILDINGS.

The development of Canada's agricultural and mineral resources, and the broadening of the scope and multiplication of her manufacturing activities, are largely, if not altogether dependent, on the railroad mileage available; not main line altogether, important of course as that is, but particularly as to the main line feeders or branch lines. Next in importance to mileage is rolling stock—locomotives and cars. The accompanying article features a plant and equipment specially designed to produce the latter, and although of comparatively recent establishment, it will be seen to have embraced an opportunity and turned it to account.

Staff Article

ON the tenth day of September, nineteen hundred and twelve, several carloads of construction material arrived on a stretch of land on the eastern outskirts of the city of Hamilton, in the Province of Ontario, Canada. Such an occurrence has taken place on many occasions throughout the country and to the casual observer at that time, the incident was probably neither more nor less interesting than hundreds of other similar incidents. If the observer could have foreseen the extensive plant which was to arise on the surrounding land, and realized that within 4½ months the shipment of finished railroad cars would be an accomplished fact, he would have been constrained to pay more than passing attention to the seemingly ordinary event of a few freight cars arriving on a piece of vacant ground.

The land referred to is situated at the eastern end of Burlington bay, on the southern foreshore of that inlet and less than 30 minutes ride on the city cars from the Canadian Pacific or Grand Trunk Railway depots. It has an area of almost 58 acres, being 800 ft. wide and 3,150 ft. long. It is quite level naturally and being of rectangular shape is admirably adapted for the specific purpose of the plant erected on it.

GATE HOUSE AND EMPLOYMENT OFFICE AT ENTRANCE TO GROUNDS.

WOOD AND STEEL STOCK YARDS WITH GANTRY CRANE IN FOREGROUND.

Inception of the Company

Incorporated on July 11, 1912, the National Steel Car Co. was organized by a group of prominent Canadian capitalists to undertake the manufacture of all types of steam, electric and street railway passenger and freight car equipment. Taking place as it did when car works were being rushed for deliveries, the inception of the business was attended by some delay in obtaining the desired amount of trained help. Fully 90 per cent. of the workmen were recruited from the ranks of the local inhabitants and as it was necessary to train them in the art of car building, the desired state of efficiency was not obtained so quickly as it otherwise might have been.

Under these circumstances, therefore, the feat of erecting and equipping shops, organizing a force and making shipment of completed cars on Jan. 31, 1913, less than five months from the breaking of ground is deserving of more than passing remark.

General Features of Plant

The plant consists of two large buildings which contain the equipment for

MAIN OFFICE BUILDING.

accomplishing the principal manufacturing operations, while several buildings are provided for various purposes such as office buildings, storage, hospital and works offices. The two main buildings referred to are situated north and south of each other the northern one being known as the main shop in which are located the steel and woodworking plants. This building is of steel construction of the monitor type and consists of three bays, two of which are 75 feet, and one 50 ft. in width. The walls are built of hollow fireproof tile for a height of eight feet above ground, and are of continuous steel sash above.

VIEW OF STOCK YARD FROM SOUTH.

Reception of Raw Material

In strict conformity with modern practice, the equipment is laid out so that movement of the work is in one direction only, not in the buildings alone, but in the plant as a whole. When raw material is received by rail, it is immediately deposited in the northern end of the grounds. Here are the steel and lumber yards where immense quantities of steel shapes, wheels, shafts, and thousands of feet of lumber are held in readiness for consumption.

VIEW OF POWER HOUSE WITH SILO FOR WOOD WASTE.

Much of the lumber is stored in piles, where it is subject to natural seasoning, while material required for early use is passed through a dry kiln and thence to the dry kiln storage.

The dry kiln is 100 ft. long by 60 ft. wide, and contains five tracks, a traverser being provided to enable trucks from the lumber storage to be run right in without transferring the material from one truck to another. The kiln was designed and erected by L. Moore Dry Kiln Co., Jacksonville, Fla., and is heated by steam, the walls being of fireproof hollow tile.

After treatment in the kiln, the lumber is transferred to the dry kiln storage, from which it is transferred by overhead traveling crane to the planing mill department. This crane passes over the steel yard and can be observed in several of the photographs. It has a capacity of 10 tons with a span of 60 ft., and the runway on which it travels extends for a distance of 520 fet. By this arrangement heavy materials are quickly stored to the best advantage, and are yet within easy access of the various departments in which they are to be used.

Car Construction

The work of producing cars may be divided into three main classifications, running gear, structural work and woodwork. The first includes the making of forgings, stampings, bolts, nuts, rivets, pins, hooks, chains and other similar details; also wheel boring, axle turning and preparation of various components ready for assembling into finished trucks. The second classification embraces the cutting off, marking, punching, shearing and drilling of plates, beams and sections from which the steel frame work of the car is to be fabricated. Lastly, the wood must be selected and machined to size in readiness for building into bodies of various types with a minimum of labor.

Co-ordination of Departments

Work of these three descriptions proceeds along parallel lines both practically as well as theoretically. At the northern end of the three bays referred to, raw material enters from the stock yards of which mention has been made

Rough bars and rods of many shapes enter the forge department in the 50 ft. bay. In the adjacent 75 ft. bay beams and shapes of all sorts which have been cut to length in the cutting off department now make their appearance, along with plates which are trimmed to various shapes and sizes, and have holes punched or drilled to suit different templates. In the other 75 ft. bay, planers, moulders, cutting off saws and drills are engaged on woodwork as mentioned. These three departments are each the starting point for work of one classification which gradually assumes a more complete form with each succeeding stage until merging with the other product it becomes a complete piece of rolling stock ready to be stencilled with weights, lengths and the several hieroglyphics which decorate the modern freight car.

BASIL MAGOR,
Vice-President and General Manager.

Forging Department

Forgings used on railway rolling stock are subject to severe treatment both from work and weather. Their proportions must be ample, their quality good, and their dimensions accurate. Drop hammers and bulldozers therefore form a large part of the equipment, while much of the medium and light welding and forging is done in power-driven hammers. The equipment is all modern and of the most suitable type for this class of work. Among the principal items may be mentioned 1-5,000 lb. Chambersburg steam drop hammer; 1-3,000 lb. and 1-1,500 lb. Erie steam drop hammers; 3 Erie trimming presses, and 1 board hammer. Three Ajax bulldozers with independent motor drives and individual oil furnaces handle a large variety of hot stampings.

A feature of this department is a complete rivet making plant consisting of a continuous Ajax machine driven by a 20 horse-power C. G. E. induction motor. In line with the machine is an oil-fired furnace of sufficient length to receive stock lengths of rod, the capacity of the furnace being such that the machine can be kept constantly supplied with hot rods.

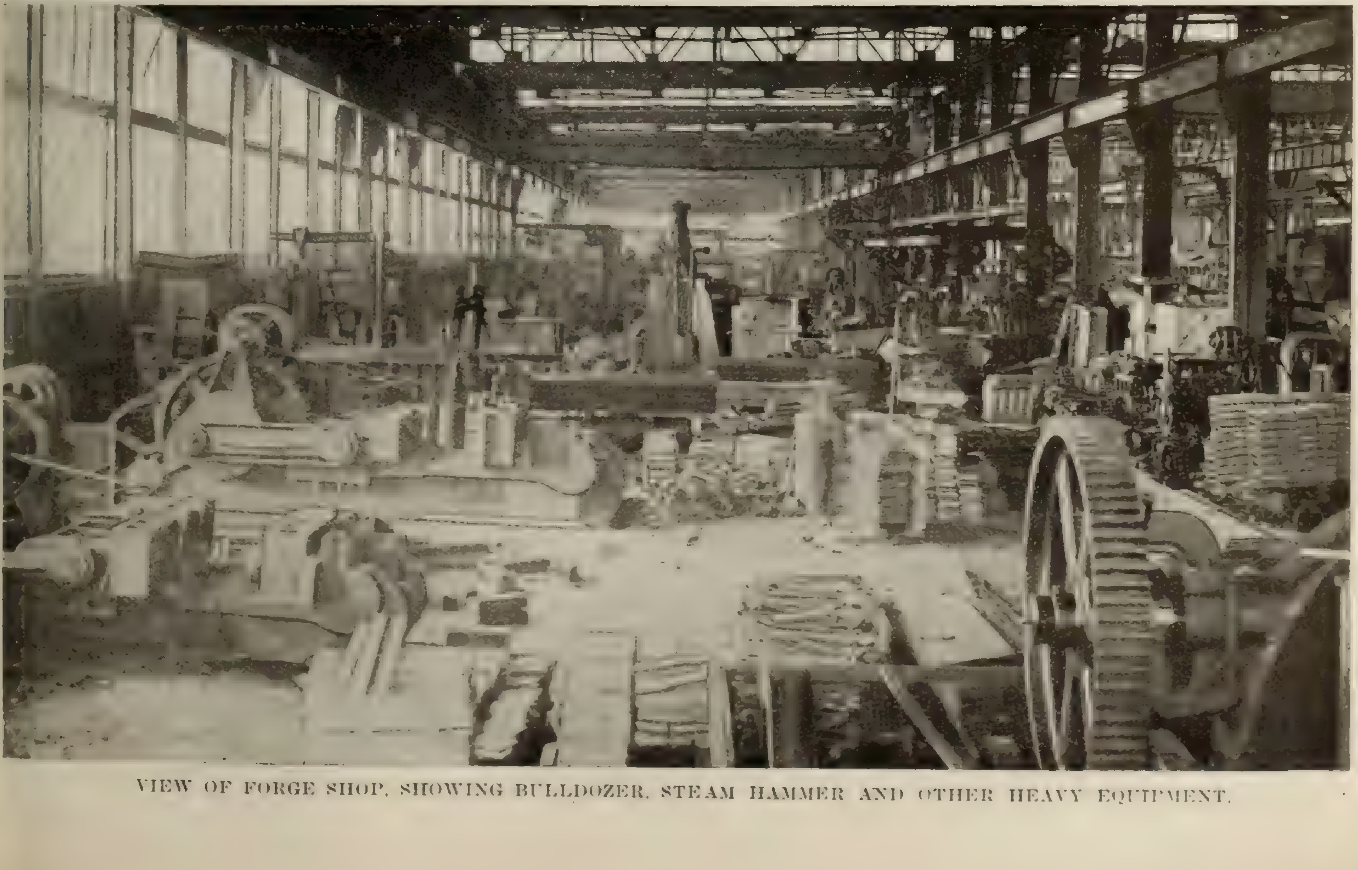
The general forging equipment is capable of handling a large variety of work, and includes one 1,500-lb. Chambersburg steam hammer; one 200-lb. and two 100-lb. Bradley cushioned helve hammers, and one No. 11 Baudry power hammer.

Drilling Department

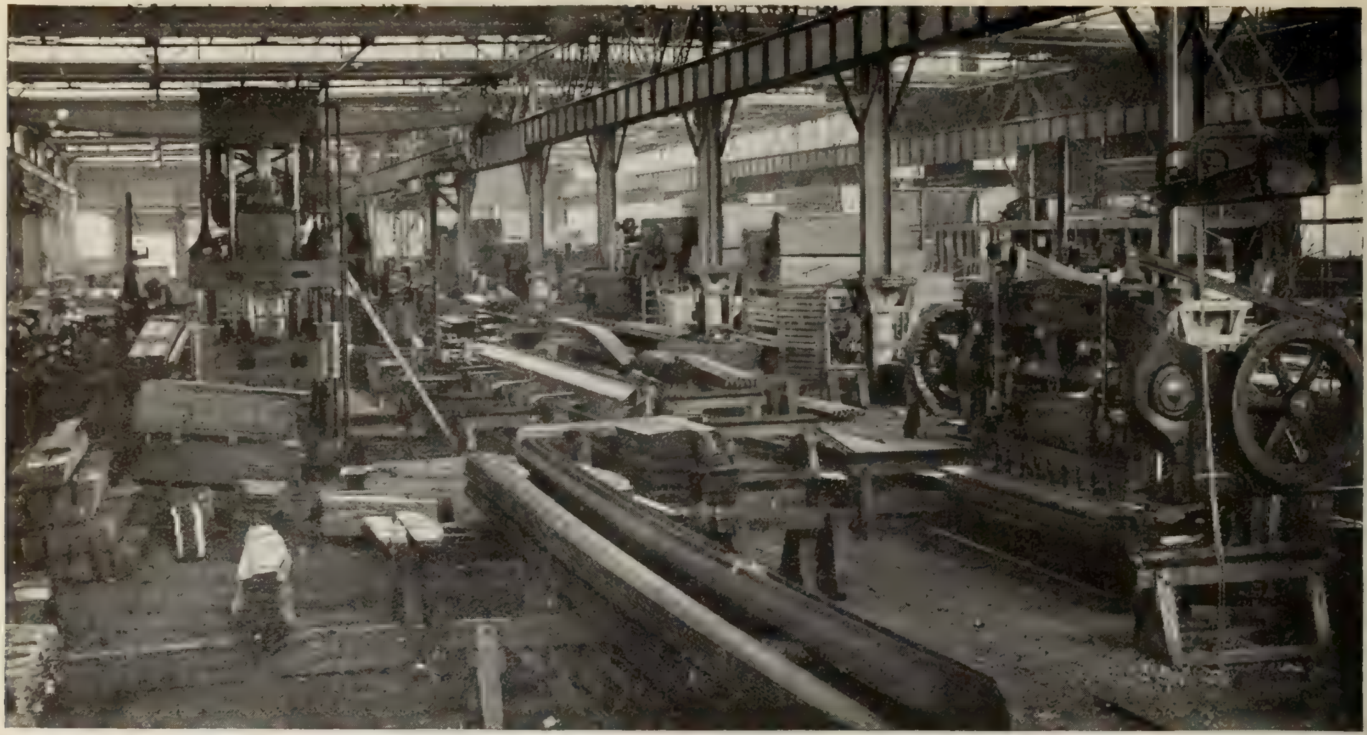
Some of the work as done in the forging department is ready for use, but a considerable part requires both drilling and machining. Many of the smaller parts from the steel preparation department also require drilling, so that a considerable equipment has been provided for this purpose. Approximately twenty machines are engaged in this department, consisting mostly of medium-sized vertical drill presses, with such special machines as 1-6 and 1-5 spindle multiple drill, and 1 Bausch 15 spindle drill for special repetition work. A Lapointe broaching machine is also installed, this type of machine being particularly adapted for machining slots, oval and irregular holes of all descriptions.

Machine Work

Owing to conditions existing during



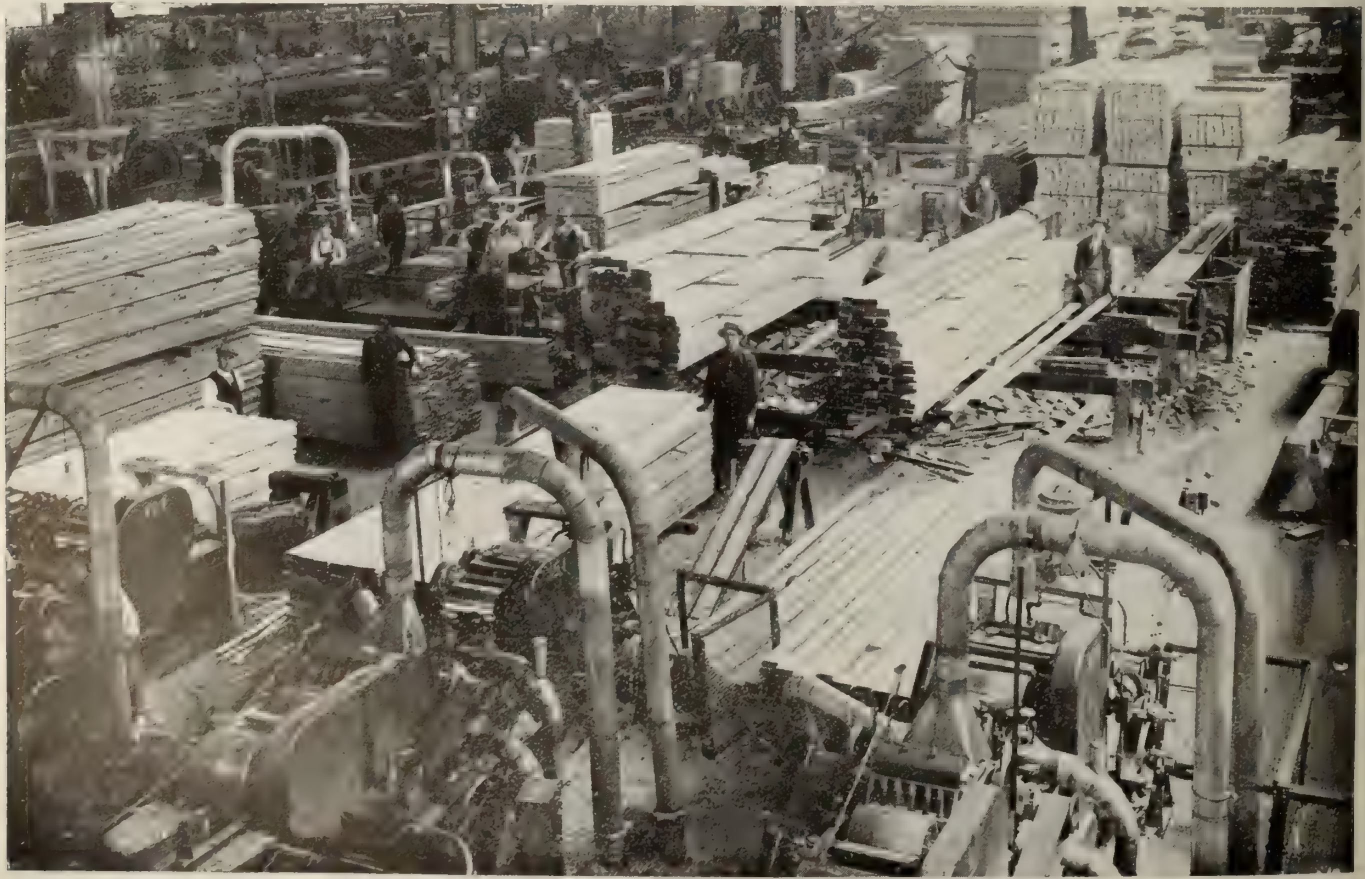
VIEW OF FORGE SHOP, SHOWING BULLDOZER, STEAM HAMMER AND OTHER HEAVY EQUIPMENT.



STEEL PREPARATION DEPARTMENT, SHOWING LARGE TWIN CYLINDER HYDRAULIC PRESS, PUNCHING AND SHEARING MACHINES AND WORK IN PROGRESS.

the past two years, work of a much greater variety has been undertaken than was originally anticipated. Deviations from standard designs have involved a greater variety of equipment in the machine shop than would have been the case had the class of work remained of a more or less specialized nature. The present machine shop which covers a floor space of about 50 ft. long by 75 ft. is being doubled in area. Approximately 50 tools are installed and these are being constantly added to. As the output of the plant during recent months has included such diverse products as steel sleeping cars and field kitchens, passenger coaches and trench trucks, freight cars and ammunition wagons, the varied nature of the machine shop equipment has been of particular value in handling the constantly changing type of work.

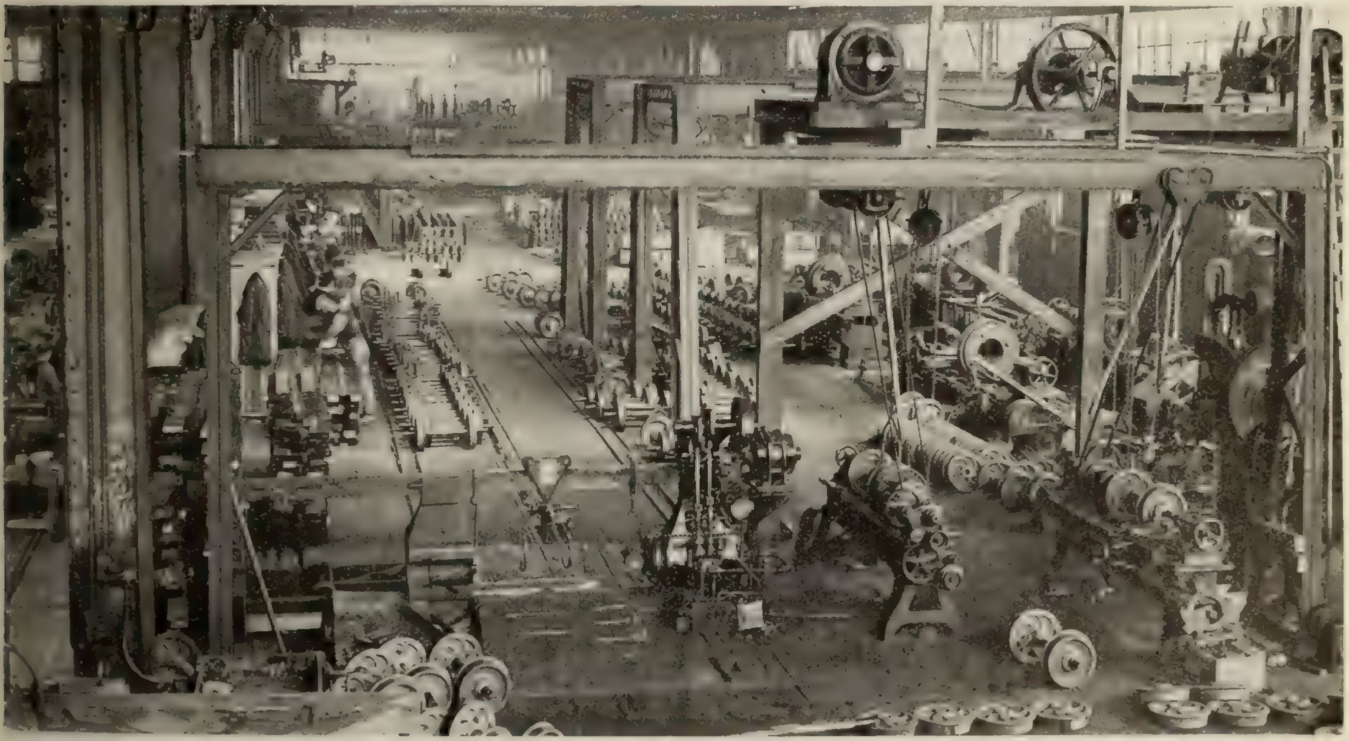
Among the tools in this department are the following:



PLANING MILL WHERE LUMBER IS MACHINED TO SIZE AND SHAPE READY FOR USE IN CAR ERECTION DEPARTMENT.

One 36x36x144 Butler planer.
One 36x36x144 Pond planer.
One 24x24x120 Bertram planer.
Three Bertram slotters, 20, 24 and 28 inches.
One Putnam slotter.
Two Bertram shapers.
One C.M.C. shaper.
One Besley horizontal disc grinder.
One Jones & Lamson turret lathe.
One Gisholt turret lathe.
Nine engine lathes.
Four C.M.C. axle lathes.
One C.M.C. car wheel boring mill.
One Bertram wheel boring mill.
One Newton horizontal milling machine.
Five plain milling machines.
Two Becker vertical milling machines.
One B. & S. No. 4 universal milling machine with constant speed drive.
Two Ford Smith grinding stands.

Where considerable repetition work is necessary, modern quantity production methods are made full use of, especially in milling operations on small links, rod ends, pins and other similar parts entering into the construction of trucks.



WHEEL SHOP WHERE WHEELS AND AXLES ARE ASSEMBLED READY FOR TRUCKS.

Wheel Shop

Wheels and axles are received in the rough state and require to be bored and turned before they can be assembled with the truck frames. One of the photographs shows the wheel shop in a state of normal activity, the pressing of the wheels on to the axles being done in a Bertram car wheel press, observable in the left foreground of the picture.

All of the parts which have originated in the forge or machine shops are now ready to build into trucks which is done in the centre bay. The various structural parts entering into the trucks have meantime been prepared in the steel preparation department where the steel underframes have also been fabricated.

Steel Preparation Department

A cutting-off shop is arranged close to the steel yard where preparatory operations are done on joists, beams, angles, etc., so that when they enter the centre bay of the main shop, the work of marking off holes, punching, drilling, rivetting, etc., can proceed right away. The cutting off shop contains four Lea-Simplex cold saws, which handle the structural sections, while two Cleveland automatics are engaged on bar stock, turning out shackle bolts, clevis pins and similar parts.

The steel preparation as already mentioned proceeds parallel with the forge and machine shop work. It occupies the north half of the bay which is 680 ft. in length, the south half being devoted to truck erection where the product already referred to awaits the arrival of the structural parts. The machinery consists principally of punches and shears, among them being the product of both Canadian and American tool builders. Bertram, C. M. C. and Brown-Boggs are well represented, the latter having a 10 ft. shear, while the two former makers have both punches and shears, many of the punches being of the multiple type. One large machine is equipped for punching numerous holes simultaneously at any part of a 10 ft. length of beam.

In the illustration of this department will be observed a large hydraulic press. This machine which was supplied by the R. D. Wood Co., is specially designed for car shop use, and is really two machines in one. It is similar in general construction to the hydraulic forging presses now so extensively used in shell manufacture, but has twin cylinders which can be operated simultaneously. When this is done the upper platens are bolted together so as to accommodate dies of considerable dimensions for pressing such articles as bolsters, side frames, etc. A large oil-fired furnace of suitable capacity is located to the left of this press, where the material to be stamped is heated up to the proper temperature.

Steel Erection and Truck Department

Having traveled along the 300 odd feet of this department, the various parts arrive at the truck department where riveting, bolting, and assembling proceeds. Pneumatic equipment is largely in evidence here, Cleveland hammers, drills, and similar apparatus being liberally provided.

It is now that the numerous parts begin to take on a semblance to familiar objects. Wheels are placed on tracks, and truck frames, springs, brake gear, etc., assume their various positions with wonderful rapidity until, with the placing of the main frame on the trucks, the car is ready to receive the particular type of body required to render it fit for service.

Wood Preparation

The planing mill department has meanwhile been preparing the lumber out of which the body is to be built. Here again design and organization make themselves apparent. Planers, moulders and matchers deliver the work in gradually advanced stages, being then cut to length in continuous feed cut-off saws, after which holes are drilled, morticed and recessed, special shapes formed and all work done so that the various pieces of lumber fit together exactly when they are built up on the underframe of the car.

CARS IN COURSE OF ERECTION IN FREIGHT CAR ERECTION DEPARTMENT.

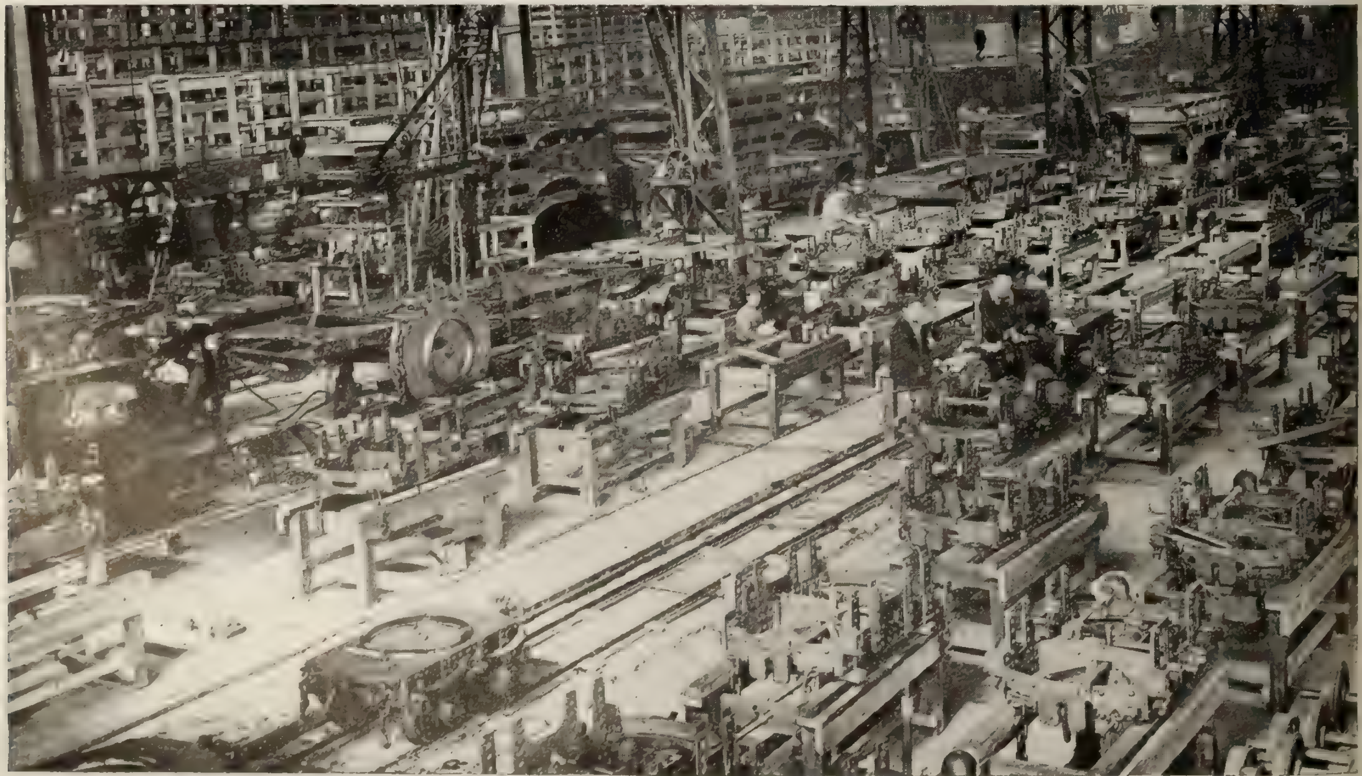
This department is equipped with a Sheldons exhaust system for removing all dust, shavings and similar refuse which are drawn through suction pipes by a powerful fan, and then forced a considerable distance through an overhead pipe to a silo on top of the power house, being then distributed to the furnaces of the boilers underneath.

The work done in the wood car department marks the practical completion of the car with the exception of painting. During the building of the body much detail work is done involving the use of purchased supplies, fittings, etc., and in order to have these promptly available an extensive stores department is provided. All of the rivets, bolts and nuts used in construction are made in the plant, and the stocking of these alone calls for considerable binnage.

Much of the lighter material and many detail parts and fittings are not suitable for manufacture in a plant of this description, and with the production of passenger coaches and sleeping cars, the variety and extent of material which it is necessary to carry in stock assume large proportions. The extent of the stores department will be unde stood when it is stated that upwards twenty employees, including a stores o fice staff, are required to handle, r ceive and deliver the goods passin through. Upholste ing material, ha springs, carpet lighting fixture lavatory and toil fittings, and sp cial equipment t meet different sp cifications, all hav to be secured wit in stated period and kept in prope condition for ulti mate use on the fin ished product.

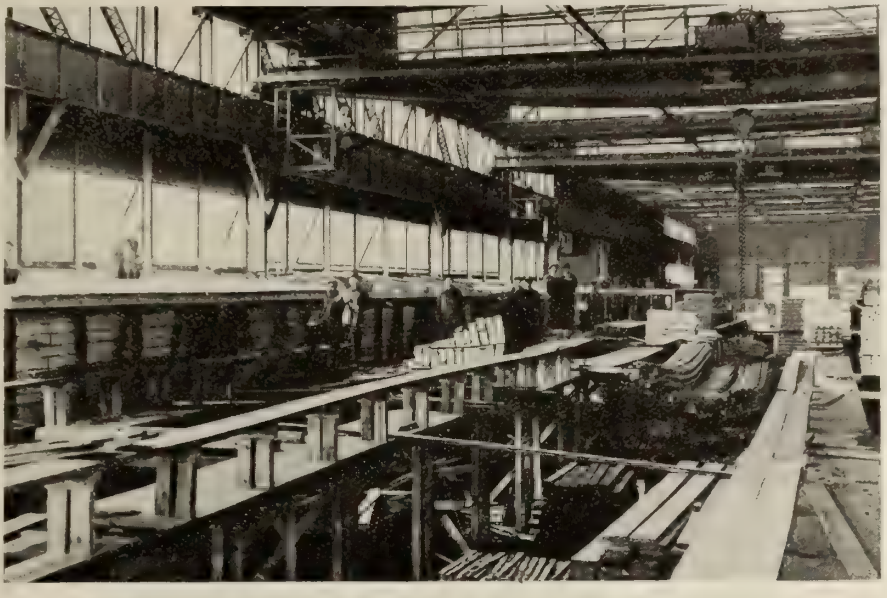
Passenger Rolling Stock

The production o modern passenge cars, whether o steel or wood, call for considerable de tail work involvin skilled labor of high order includ ing cabinet making upholstering, painting and decorating A special planing mill for perform ing machine work on car detail exclusively forms part of the sout building. It is completely equippe with morticers, band saw, sander, an drills and prepares all of the parts mad of rare and expensive woods which fur



NARROW GAUGE TRENCH TRUCKS IN COURSE OF CONSTRUCTION FOR A EUROPEAN GOVERNMENT.

nish and decorate the interiors of modern rolling stock. Here the bulkier parts are reduced to size and prepared as far as possible for the final fitting in the car. The smaller pieces and the making of seats, cushions, etc., is carried on in the cabinet department on the floor above. Window frames, sashes, seats, springs, etc., are here in profusion in all stages of completion. A special drying kiln and two veneer presses are installed on this floor so that close attention can be given to this important work.



FINISHING FREIGHT CAR BODIES IN ERECTION DEPARTMENT.

Meantime, the car bodies having been mounted on their trucks, the cars are moved into part of the south building where they are furnished with the details from the cabinet shop, and have all wiring for lights, plumbing fixtures, floors, carpets and other interior furnishings installed, the painting, varnishing and decorating being performed at such times as suit the progress of the work.

All-Steel Passenger Cars

The first all-steel sleeping car made in Canada has recently been completed in these works and has aroused considerable interest among railway officials as well as the general public. In these cars which have been built for the Government lines first consideration has been given to safety, comfort and appearance. The only inflammable materials in the car of this type are the berth curtains and the bedding, and as the steel construction renders it impervious to fire from outside causes, fire cannot seriously endanger the occupants. Other important safety features are the locking attachment which eliminates any possibility of the trucks being detached from the body of the car, and brakes of the clasp type which provide twice the braking power of the ordinary type.

The exterior of the car of which we reproduce two views, presents a handsome appearance, designed in the conventional type, and finished in the standard dark olive green of the Canadian Government Railways. An electric storage battery for lighting purposes is located midway between the trucks, the battery being maintained in a charged condition by a generator driven from one of the axles.

Interior Features

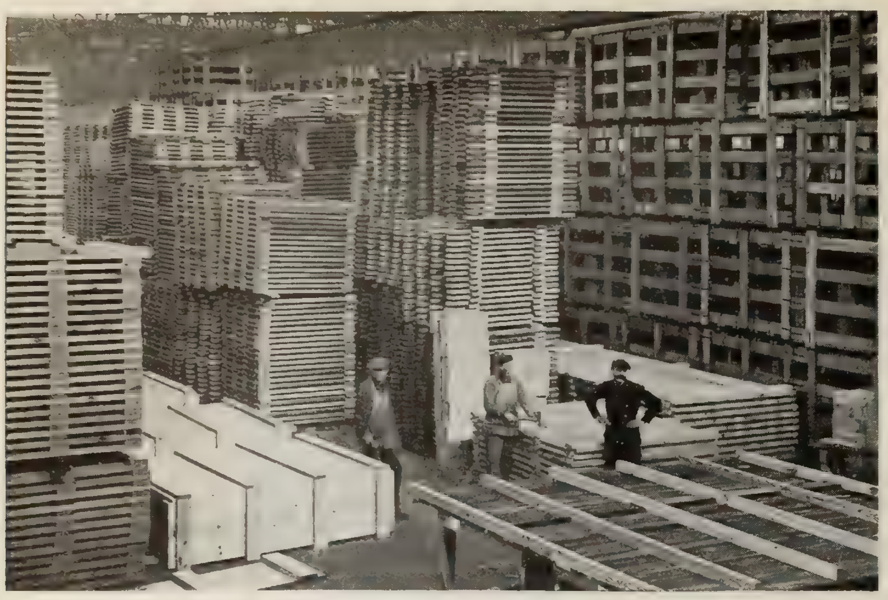
Internally the car is very attractive. The general treatment of walls, seat ends and other exposed parts is Cuban mahogany, while the seats are upholstered in the finest of green plush. The floor is of flexolith, a fireproof material resembling concrete, this in turn being covered with rubber matting. Wilton carpet is laid on the aisle and in the drawing rooms and salons. Ten compartments are provided, consisting of a lower and an upper berth. Lavatory accommodation is particularly tasteful, the ladies' lavatory being finished in white tiles on the floors and walls, with exceptionally large mirrors of finest French plate.

The mens' smoking room is finished in Koko wood, large lounge seats providing the maximum of comfort during long trips. Two very fine drawing rooms are included in the design, one being in Vermilion finish and the other in Old English.

Motor Truck Production

The extension of the company's activities in the direction of motor truck construction was but a natural sequence to

VIEW IN PASSENGER CAR ERECTION DEPARTMENT.



CRATING DEPARTMENT FOR FOREIGN SHIPMENTS.

the successful accomplishment of railroad car building. The public demand for satisfactory equipment in this line has had a steady and persistent growth which along with the growing experience of truck users pointed to the fact that a high-grade truck of moderate initial cost, built in a suitable range of sizes, and backed by satisfactory service, was the logical result to be expected from such a firm as this. The result of much careful preparation and investigation is apparent in the line of trucks offered.

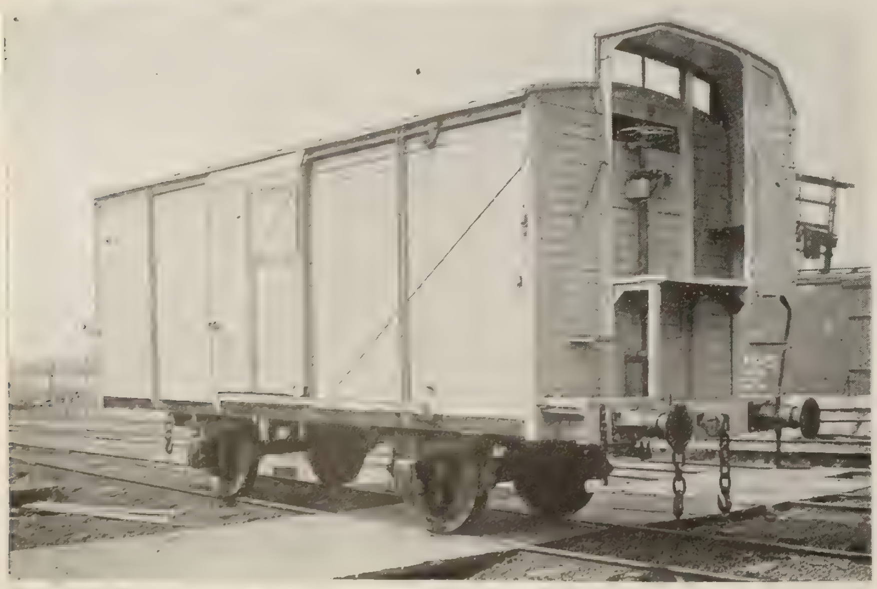
Five designs are made, the capacities being, 1, 1½, 2, 3½ and 5 tons respectively. Each model is a complete product in itself. Simplicity, accessibility and maximum service are the dominant features of all. That the efforts of the engineering staff toward this end have not been in vain will be gathered from a brief description of the trucks. Moderate speed motors of ample power are employed. They are all of the four-cylinder, water-cooled type with cylinders cast in pairs. In the 1-ton size the transmission forms a unit with the motor, but in the larger sizes it is o separate construction, both engine an transmission having three-point suspension. Power from the transmissio is carried to the worm-driven rear axl by a tubular propellor shaft of drawi steel, having a universal joint at eacl end. The transmission gears are ver large and are of heat-treated chrom nickel steel, a right-hand gear-shiftin lever operating in a selective quadran giving three speeds forward and on reverse.

Worm Drive and Other Features

All sizes of trucks are equipped witl worm-driven, full-floating axles of th David Brown type, in which the worm i mounted on top of the worm wheel, an the worm wheel and differential ar mounted as a unit in a cast-steel carrie bolted in position in the centre housin of the axle. This permits the read disassembling of the worm, worm wheel and differential, without removing th axle from under the truck, the weight o the vehicle and load being carried o heavy steel tubes, forced under hydrauli pressure into cast-steel housings.

ALL STEEL SLEEPING CAR FOR CANADIAN GOVERNMENT RAILWAYS.

A feature of interest to truck owner is the provision of a speed governo which automatically controls the maximum speed by means of a centrifuga governor, which forms an integral par of the motor, being enclosed in th motor casting and sealed. Where opportunity renders it desirable, th power from the motor may be utilize for such purposes as operating dum bodies, winches, cranes and so forth, b means of a suitable attachment designed for this purpose. Tungsten stee valves insure freedom from valve grinding while the pistons, which are tapere to provide for expansion, are fitted wit compound, leak-proof piston rings. A high-tension, waterproof magneto wit dual system of ignition, and a high grade automatic carburetor indicate th efforts which have been made to insur freedom from operating trouble.



EUROPEAN TYPE OF FOUR-WHEELED FREIGHT CAR.

Welding Shop

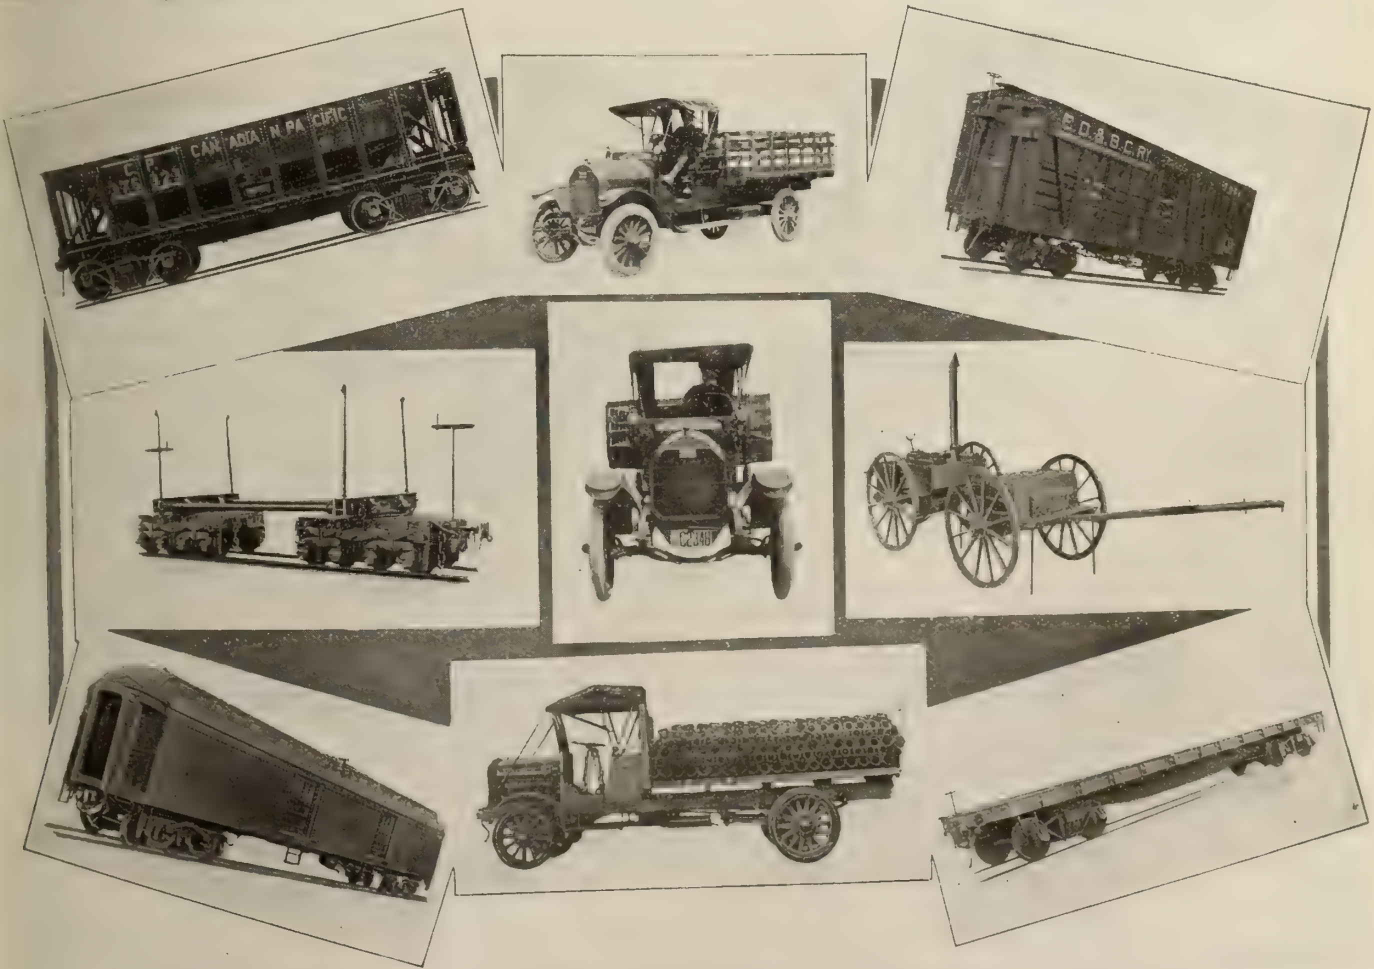
No development of modern science has been overlooked regarding its suitability for adoption as a manufacturing process, and it is not surprising, therefore, to find that oxy-acetylene welding has been adopted on a considerable scale as a manufacturing process. The rapidity and economy with which odd-shaped pieces can be produced with this apparatus have displaced much expensive forging work previously done by hand in the smiths' shop. Cutting stock of all sections to odd shapes, welding sheets, plates, straps and stampings to form standard items of car construction can be performed with an ease and economy previously unknown. The equipment in this department is of Canadian design and manufacture, the entire outfit being supplied by L'Air Liquid Society. Two large generators for producing acetylene gas from carbide are installed in a well-ventilated building about 75 ft. square, which provides ample room for ten or twelve operators to work in comfort. Part of the floor space is set apart for finishing, bench and grinder equipment being provided for three operators for dressing off rough edges, etc.

END VIEW OF STEEL SLEEPING CAR.

Power Plant

The supply of power for a plant of this nature is a problem of considerable importance, and has been solved by utilizing both steam and electricity wherever either of these systems proved better adapted than the other. The majority of the metal working machines are of large size and widely separated, being thus suited for individual drive by electric motor, while steam hammers, kilns, heating system and hydraulic pumps provide a considerable load for the boiler installation. The power house equipment consists, therefore, principally of steam driven apparatus.

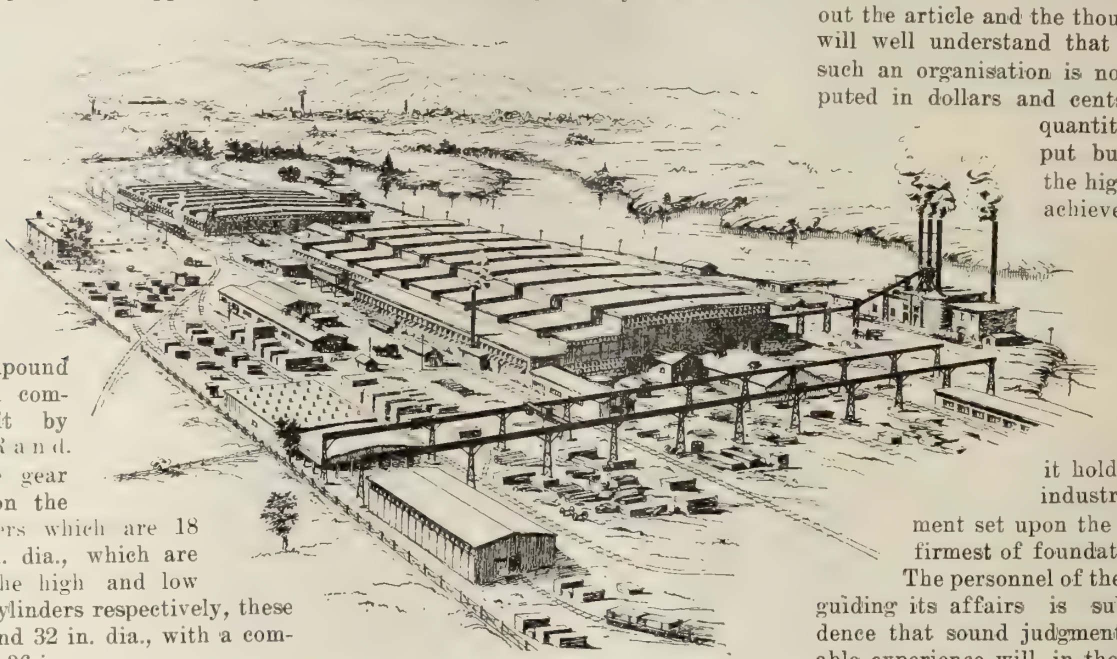
Hydraulic power is provided by 4 large Burnham compound pumps of the



PRODUCTS FOR RAIL, ROAD AND TRENCH PURPOSES BUILT BY THE NATIONAL STEEL CAR CO.

outside end packed plunger type working at a pressure of 1,500 lb. per sq. in. in conjunction with a 90 ton Wood accumulator. These pumps are served by a jet condenser supplied with water by a regular type of Burnham pump.

Pneumatic power is supplied by a cross compound steam driven compressor built by Canadian Rand. Corliss valve gear is provided on the steam cylinders which are 18 in. and 34 in. dia., which are coupled to the high and low pressure air cylinders respectively, these being 20 in. and 32 in. dia., with a common stroke of 36 in.



BIRD'S-EYE VIEW OF WORKS, SHOWING PRINCIPAL FEATURES REFERRED TO IN ARTICLE.

Boiler Equipment

The boiler equipment consists of five water tube boilers, three of those being built by the Erie City Iron Works and of 250 horse-power each. The other two are by Goldie McCulloch Co., and of 300 horse-power capacity each. Burnham feed pumps, and a Cochrane feed water heater complete the equipment. A conspicuous feature of the power house illustrations is the large exhaust pipe which carries shavings and other refuse into a silo well above the boilers from whence the fuel descends by gravity into the furnaces.

The office building is of utilitarian design and construction, being built of hollow tile, and furnished to suit the requirements of the different departments. Included in this building are the mechanical engineering, purchasing, accounting and treasury, executive and photographic. The company maintains its own emergency hospital and ambulance. Stretchers are located within a minute's distance of any part of the plant while notices in three foreign languages are posted in conspicuous positions where danger may arise. All minor injuries however slight are given immediate attention and that such efforts are fruitful is shown by the record of the past two years when as many as 2,000 men have been employed. During this period, no fatal accidents occurred, no legs were broken, one arm was amputated and two arms broken.

In the basement of the main office building is situated the restaurant for office staff and foreman. The necessity for such a facility was rendered evident by the distance of the plant from suitable establishments at which the employees could secure meals, also because experience has shown that makeshift efforts by the employees on their own behalf are not always maintained at a sufficiently high standard to conduce to the best state of efficiency physically or mentally. Permanent arrangements by the company resulted in the establishment of an up-to-date department including a fully equipped kitchen.

The nature and extent of the operations constantly proceeding will be apparent from the illustrations throughout the article and the thoughtful reader will well understand that the value of such an organisation is not to be computed in dollars and cents nor by the quantity of the output but because of the high standard of achievement which it holds forth as an industrial establishment set upon the broadest and firmest of foundations.

The personnel of the men who are guiding its affairs is substantial evidence that sound judgment and invaluable experience will, in the future as in the past, continue to characterize the policy of the company in all its affairs. The Board of Directors as at present constituted consists of the following gentlemen:—

President. — Sir John M. Gibson, K.C.M.G.

Mortimer B. Davis, President Imperial Tobacco Co., of Canada.

First Vice-President.—Basil Magor.

Second Vice-President.—Sir Henry M. Pellatt, C.V.O.

W. G. Ross, Chairman Montreal Harbour Commissioners.

C. H. Cahan, K.C., President Western Canada Power Co., Montreal.

R. J. Magor, Managing Director, Magor Car Co., New York.

J. J. Scott, K.C., Hamilton.

Murray H. Coggeshall, Coggeshall and Hicks, New York.

W. Kirkpatrick Brice, New York.

Samuel King, London, Ont.

NORTH SIDE OF SHOPS, WITH EMERGENCY HOSPITAL AND PRIVATE BOAT DOCK IN FOREGROUND.

The Mineral Production of British Columbia During 1915

By E. A. Haggen, M.E. *

The data here given details the salient features of the Annual Report of the Provincial Bureau of Mines for the year 1915, and incidentally constitutes the first authentic statement of the mineral production for that year. It will be observed that the aggregate output foi 1915 approaches the high records of 1912 and 1913. A noteworthy development is that of the establishment of local refining plants for the treat ment of copper and zinc ores.

THE annual report of the Provincial Bureau of Mines for 1915 is one of the best that has been issued by that department. It gives the first authentic statement of the mineral production for the past year, which stands third highest in the mining records of the Province. The total production is stated at $29,447,508, and was beaten in 1912, when the figures reached a total of $32,440,800; also in 1913, when the production reached $30,296,398. The figures are as follows for the year ending December 31, 1915:—

Mineral.	Quantity	Value	Increase over 1914	Decrease Under 1914
Gold, placer		$ 770,000	$ 15,000	
Gold lode, oz.	250,021	5,167,934	58,530	
Silver, oz.	3,366,506	1,588,991		$ 287,745
Lead, lbs.	46,503,590	1,939,200	167,323	
Copper, lbs.	56,918,405	9,835,500	3,714,181	
Zinc, lbs.	12,982,440	1,460,524	1,114,399	
Coal, tons	1,611,129	5,638,952		699,433
Coke, tons	245,871	1,475,226	67,764	
Miscellaneous		1,571,181		1,281,736
Total		$29,447,508	$5,237,197	$2,268,914

The net increase over the previous year is thus $3,058,685, due mainly to the output of copper and the exceptionally high prices for that metal ruling during the latter part of the period. The remarkable increase was in zinc, the production of which increased nearly 100 per cent., while the selling price showed an increase of over 400 per cent. With the increase of copper production, gold and silver might have been expected to show a greater increase, as these metals always accompany copper in this country.

The decrease in coal consumption is due to the inroads of fuel oil, a condition which the increasing price of oil and the additional cost due to the new tariff will no longer permit to continue.

It is interesting to note that the mineral production of the Province has exceeded the half billion mark, $516,270,253, to be exact. Of this amount gold accounts for $160,803,053, of about 35 per cent. Coal accounts for $156,928,640, or about 30 per cent. Copper ranks next with $96,774,870, or about 18 per cent. Silver comes next to copper in importance, with $39,298,273. Lead figures reach $33,407,662. Building material production, involving bricks and building stone, is valued at $25,398,282. Zinc production amounts to $3,659,473.

Placer Gold

The placer gold return for 1915 is the highest since 1907, and was mainly due to increases in Cariboo and Atlin, which two districts produced 90 per cent. of the total. Owing to the number of men out of work last summer there were more individual parties working than usual on the Fraser, Thompson and Quesnel Rivers. Atlin production is placed at $377,000; Cariboo at $215,000; Quesnel at $85,000; East Kootenay, where for some years placer gold mining has been negligible, produced $15,000, and Similkameen, Nicola and Vernon rose from $3,000 to $12,000; Nelson yielded $1,000; Revelstoke, Trout Lake and Lardeau, $2,000; Boundary and Yale, $2,000; Yale, Ashcroft and Kamloops, $10,000; Lillooet, $8,000; the coast districts, including Vancouver Island, are credited with $2,000.

Lode Gold

Increased ore production in Boundary and Rossland and opening of new properties in Skeena and Omineca accounted for the increase in lode gold, in which the Coast and Nelson districts showed a decrease.

The lode gold production was not so great as in some previous years, the output having been nearly half a million more in 1913, $150,000 more in 1912, $35,000 more in 1910, and nearly $100,000 more in 1908, so that lode gold mining is not making the progress it should. Rossland leads with 142,595 ozs., and Boundary ranks next with 87,870 ozs., mostly derived from the smelting of copper ores carrying gold. Nelson and the Coast districts show a falling off, the former of 6,000 ozs. Similkameen was the largest producer of free gold, the Hedley Gold Mining Co. output being 6,000 ozs. over previous years, and all valued at over $900,000. This district, however, is not specially given credit for the foregoing production, it being included in the Boundary returns. Nelson produced 9,233 ozs., Skeena 5,034 ozs., Coast districts 2,490 ozs., Omineca 1,524 ozs., and other districts combined 1,275 ozs. Rossland shows an increase of 4,027 ozs. over previous year, and Boundary an increase of 2,962 ozs., entirely due to the Granby production, which shows an increase of 8,000 ozs., but this is offset by the falling off in the gold output of the Greenwood smelter and the Jewel mine. Skeena shows an increase of 75 per cent. due to the production of copper ores at Anyox.

Silver Output

The silver production was the lowest in the last three years as regards quantity and the lowest in four previous years as regards value. This was the only metal which did not recover from the slump of prices following the declaration of war. The price was about 5c per oz. less than the previous year and about 10c. per oz. less than for 1913. Slocan produced 62.9 per cent. of the total and Fort Steele 14.3 per cent., the latter being almost entirely from the Sullivan mine. The following is the production of the various mining divisions: Slocan 1,812,550 ozs., Fort Steele 481,258 ozs., Ainsworth 289,565 ozs., Boundary 273,795 ozs., almost entirely as a by-product from the copper smelters; Skeena 175,179 ozs., Trail 159,584 ozs., almost entirely as a by-product of Rossland gold-copper ores; Omineca 79,155 ozs., Coast 66,033 ozs., mainly as a by-product of the copper ores from the Britannia mine; Trout Lake-Revelstoke 16,740 ozs., Nelson 9,405 ozs., mainly from Sheep Creek; and all other districts 3,242 ozs.

Lead Production

This metal showed a falling off of 4,121,458 pounds as compared with previous years, but owing to the price being three-quarters of a cent. per pound more, the value was greater by $167,323. Fort Steele division leads with 57 per cent. of the total production, mainly from the Sullivan mine. Slocan produced 32.10 per cent. of the total. The production of the various mining divisions was: Fort Steele, 26,582,050 pounds; Slocan, 14,925,345 pounds; Ainsworth, 3,436,184 pounds; Nelson, 967,775 pounds; Omineca, 249,279 pounds; all others, 342,957 pounds. The lead output was the lowest in the last three years. This is due to the fact that the lead production is mainly from argentiferous galena, and owing to the low price of silver, most of the Slocan mines were shut down for the first half of last year.

---

*Editor, the Mining and Engineering Record.

Copper Shows Record

Copper was one of the two metals in which there is a record production for 1915, the amount being over 5,000,000 pounds greater than for 1912, the next highest year. The copper production of the province has doubled in the past fifteen years, and copper mining is making such rapid strides that the production should be doubled again within the next two years. The value was about $1,500,000 greater than for 1906, when the high copper prices of that cycle reached their climax. The exceptionally large production last year was due to the enterprise of the Granby Consolidated Mining, Smelting & Power Co., which provided 66½ per cent. of the total production.

Great changes are taking place in the source of the copper output. Boundary production has fallen off 50 per cent. as compared with 1912, due to lessened ore production and reduced grade of ore. Rossland output has doubled. The output of the Coast districts has more than doubled, owing to the operation of the Granby Co. new mine and plant at Anyox, and the increased production of the Britannia. Yale-Kamloops districts are increasing in importance as copper producers, their output showing an increase of 850 per cent. in three years. Nelson produced only 51,941 pounds, as compared with 586,764 pounds in the previous year, and 815,126 pounds for 1913.

The Coast districts produced 60.65 per cent. of the total for 1915, and Boundary districts produced 30.5 per cent. Coast areas were also the richest in copper, averaging 38 pounds per ton, while Boundary ores averaged only 14 pounds, and Rossland ores only 13½ pounds copper per ton. The ores of the latter camp are, however, gold rather than copper ores.

The growing importance of British Columbia as a copper producing country is evident from the fact that for the past year the value of this metal alone was almost as much as that of all the other metals put together. At the present time Japan is the world's largest copper producer, next to the United States, but at the present rate of progress this province will, within the next two or three years, displace Japan as the world's second largest producer. The history of copper mining, too, is that it affords the most reliable and permanent of all classes of mining, so that the towns being established in connection with the copper camps can, as a rule, look forward to becoming practically permanent communities.

The question of the local refining of copper has attracted much attention during the past two years. Hitherto all copper produced here has been refined in the United States, the Boundary blister copper going to the Nichols refinery in New York State, and the copper from Trail smelter, the Britannia mine and the smaller mines shipping to Tacoma smelter, going to the copper refinery operated in conjunction therewith. The present year will see the copper refining industry established for the first time in British Columbia, a refinery to produce about ten tons of refined copper per day having been almost completed at Trail smelter.

Zinc Production

The zinc production of British Columbia is showing important strides, the amount for 1915 being about double that of 1913, while the increase over the 1914 output was 65 per cent., and about 50 per cent. over 1909, the previous high record year in zinc. The price, too, was about 160 per cent. better than the average due to the exceptional war demand. Two-thirds of the production was from the Slocan mines; 25 per cent. from Nelson division, and the rest from Ainsworth and East Kootenay.

The principal producers were: Standard Silver Lead, 3,778,857 pounds; H B., on Sheep Creek, 2,387,514 pounds; Silverton Mines, 1,385,859 pounds; Zincton, on Sheep Creek, 739,695 pounds; Retallick Mine, Ainsworth, 576,000 pounds; Lucky Jim, 788,158 pounds; Rambler-Cariboo, 546,660 pounds.

Hitherto all the zinc ores produced in the Province had to be exported for treatment, mainly to the United States. The current year has seen the important addition to the metallurgical plants of British Columbia of a zinc refinery operated at the Trail smelter.

Other Metals

The only other metals of which there was any production were molybdenite and antimony. From the Molly group, on Lost Creek, south of Sheep Creek, in the Nelson district, there were shipped 24 tons averaging 12.26 per cent. molybdenite, and on this property are several thousand tons running from 2 per cent. to 4 per cent., which it will pay to mill, and ship the concentrate. The only other molybdenite property worked is at the Reil Camp, on Alice Arm, where a mill has been built, and shipments have been made to Seattle. Molybdenite, concentrated to a grade of between 85 per cent. to 90 per cent., brings from $2,500 to $3,000 a ton.

Antimony was another of the war metals that went skyrocketing in price to 55 cents per pound, though it is now back at the normal price of about 15 cents. This mineral is common in British Columbia, but only one property is reported to have made shipments last year, and that was the Alps-Alturas, on the North Fork of Carpenter Creek from which two cars were packed and shipped to Scotland, the content being 50 to 55 per cent. antimony.

Earthy Minerals

Building stone and brick show a heavy falling off, owing to the smal amount of new construction going on the output for the year being only about half that of recent years. Two new classes of deposits were developed and small shipments made. There were the hydromagnesite deposits at Atlin owned and operated by Armstrong & Morrison, of Vancouver, from which about 70 tons were mined and shipped There is likely to be an increasing demand for this mineral on account of the development of the pulp industry The other mineral deposit worked is at the Bitter Lakes in the Similkameen where Epsom Salts occur in nature Three hundred tons were mined and shipped to New York.

Coal and Coke

The output of coal was the lowest in nine years. The coke output showed an increase of about 11,000 tons over 1914 but was still below the returns for 1912 1913, 1909 and 1908. Vancouver Island produced more coal than the whole o the mines on the mainland put together The respective production was: Vancouver Island, 1,020,942 tons; Mainland 951,638 tons. Of the Mainland mine The Crows Nest produced 852,572 ton and Nicola and Similkameen 99,060 tons.

Of the coal production 361,451 ton went into the manufacture of coke fo the smelters. Of 245,871 tons of coke produced, 5,450 tons were made a Union Bay and 240,421 tons by the Crows Nest Pass Coal Co. While th British Columbia demand for Vancouver Island coal fell off 17 per cent., exports to the United States increased.

* * *

C.P.R. AND CANADIAN TIMBER

THE Canadian Pacific Railroad ha taken the lead in using Canadian wood in its car and hotel building. It conserves some 6,000,000 acres of timbe limits, and aids in every possible way to make known this source of almos uncountable wealth—knowing that timber wealth always constitutes an eloquent appeal to the settler, prospector or capitalist. The company has jus made up some figures which show th timber wealth of the country, an these, at the present juncture, will no be without interest: Lumber, laths an shingles, $67,500,000; firewood, $60,500 000; pulpwood, $15,500,000; posts an rails, $9,500,000; crossties, $9,000,000 square timber exported, $400,000; cooperage, $1,900,000; poles, $700,000; log exported, $850,000; tanning materia $22,000; round mining timber, $500,000 miscellaneous exports, $300,000; misce laneous products, $10,000,000.

Montreal Locomotive Works Plant and Equipment.

STAFF ARTICLE

In addition to the locomotive building and repair plants connected with Canada's principal railroad corporations, outside enterprise, by close attention to and observation of possibilities, has proved itself a valuable adjunct, and has contributed in no small measure to the high degree transportation achievement which the former have to their credit, and to the outstripping of which their efforts and activities conspire. What is indicated in the foregoing is readily applicable to the Montreal Locomotive Works, Longue Point, Quebec.

THE Montreal Locomotive Works was incorporated under the Dominion Companies Act in June, 1902, and in March, 1904, the first locomotive built entirely in every detail in the company's works was delivered to the purchaser, the Toronto, Hamilton & Buffalo Railway Co.

The plant is situated about six miles north-east of the heart of the City of Montreal, between the Canadian Northern Railway on the Northwest and the St. Lawrence river on the southeast and is intersected by the Quebec turnpike which is an extension of Notre Dame street, one of the principal streets of Montreal. The property has an area of 68.1 English acres. A system of tracks connects the buildings with the railway mentioned, and through same with all the lines that radiate from Montreal. Tracks also run from the works down to the river front, where the Government has constructed a dock and basin for the accommodation of ocean steamships. It will be seen, therefore, that this company possesses every facility for the import of the raw material and export of its finished product in any direction.

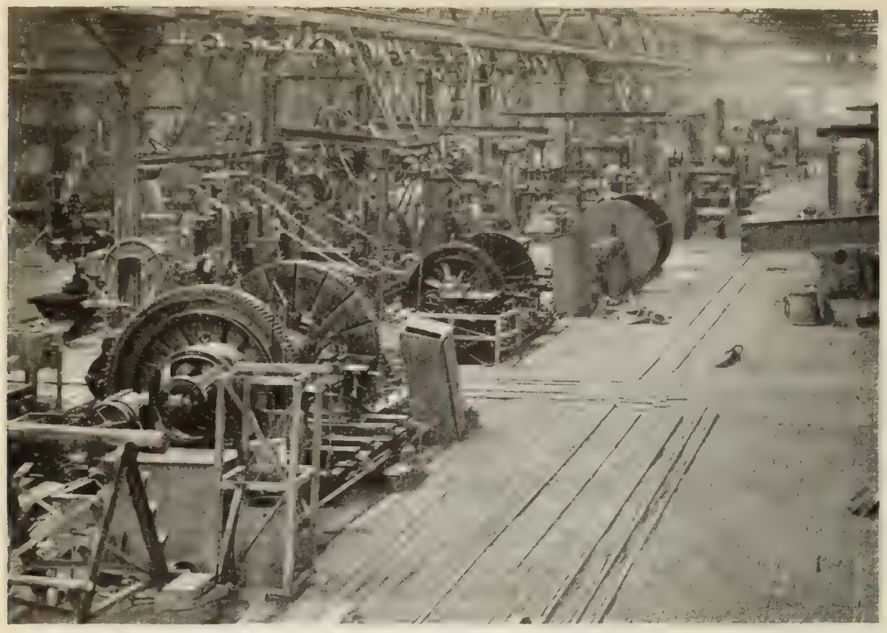
EXTREME EAST END OF NORTH BAY OF MACHINE SHOP, SHOWING PORTION OF FRAME DRILLING AND SLOTTING DEPARTMENT.

Plant Layout

The layout of the plant, which comprises 25 buildings, was the result of a careful study of the problems involved, and is believed to be unique for compactness and minimum distances of handling from raw material to the finished product. One of the distinguishing features of the arrangement is that all the principal shops necessary for the production of a locomotive are included under one roof. Objections raised against this style have been:—(1) A possible want of light. (2) Increased insurance; both of which have been met. Indeed, it is believed that no similar shop has been insured at a lower rate; the light shows for itself in the interior photographs. The main building is of structural steel framing, the columns being supported on iron pedestals which in turn stand on concrete base blocks. The side walls to a distance of four feet above the ground are of stone. At each column is a brick pilaster from the stone work to the roof, the space between the pilasters being largely of glass.

Machine Shop

The main building consists of seven different departments—hammer shop, boiler shop, tank shop, foundry, machine shop, erecting shop and running shed. The machine shop is 600 feet long and 169 feet wide, with an adjoining annex 222 feet long and 136 feet wide. The machinery in the shop as well as throughout the whole plant is electrically operated, and a large majority of the tools are equipped with individual motor drives. Tools which require frequent change of speed are



SOUTH BAY OF MACHINE SHOP LOOKING EAST, SHOWING INDIVIDUAL MOTOR-DRIVEN MACHINES, TOGETHER WITH MOTOR-DRIVEN GROUPS.

driven by variable speed motors, thus avoiding the shifting of belts and the changing of gears when change of speed is required. This results in a great saving in time and energy on the part of the operator, thereby increasing the efficiency of the shop. The tool equipment throughout the entire shop is modern and is constantly being enlarged; a liberal policy being in force by which new tools and devices which tend to accelerate the output or decrease the cost of production are installed as soon as their merits have been established.

Among some of the special machinery are several four-head planers having a bed 55 feet long and a clearance between housings of 5 feet; two triple head frame slotters—each head separately driven, having a bed 50 feet 1 inch long and 61 inches wide, and capable of slotting six bar frames at one time; universal and plain milling machines with tables running from 60 to 193 inches in length; and wheel and tire boring mills having swings from 51 to 90 inches. This shop is served by eight electric traveling cranes, five being of 10 tons capacity each, one of 16 tons, and two of 20 tons each. A large number of fixed radial cranes serve each tool where required, thus obviating waiting for the traveling cranes.

Hammer Shop

At right angles to the machine shop and on a line with the western end of it is the hammer shop. This building is 380 ft. long by 86 ft. wide. It is equipped with two large 6,000 lb. steam hammers for heavy forgings. Besides these are a number of smaller hammers for blacksmith and drop forging work, bulldozers and bolt forging machines, as well as hydraulic presses. Several radial jib cranes, with a range of 360 degrees, and equipped with air hoists or suitable chain blocks, are located at intervals along the centre of this department, and every facility is provided for the convenient and rapid handling of material and shop equipment.

BOILER SHOP, WEST BAY.

Boiler Shop

Next to the hammer shop is the boiler shop 380 ft. long by 135 ft. wide. At the south end of the shop is a riveting tower 66 ft. high, 40 ft. wide and 65 ft. 6 in. long. The riveting tower contains one 17 ft. gap, 125 ton pressure hydraulic riveter, and one 10 ft. 6 in. gap, 80 ton pressure hydraulic riveter. This shop is equipped with the latest improved machinery, including a hydraulic flanging press capable of 450 tons pressure, served by an oil furnace with capacity sufficient to take any size sheet. There are also two large bending rolls, one 12 ft. 3 ins. between housings and the other 16 ft. 4 in. between housings; a plate planer and a number of large

SMITH SHOP SHOWING PART OF DROP-FORGING FLOOR.

punches and shearing machines. One of the main features of this shop is the plate drilling equipment consisting of several large radial drills having special heads. All holes subjected to steam pressure are drilled instead of being punched. The several fires in the shop are served by fixed radial cranes. For traveling heavy pieces through the shop, cars are used on a centre track. This shop is also served by five electric traveling cranes, one of 10 tons capacity, one of 20 tons, one of 25 tons and two of 60 tons each. Alongside the boiler shop is the tank shop 380 ft. long by 66 ft. wide.

SMITH SHOP, LOOKING SOUTH.

Erecting Shop

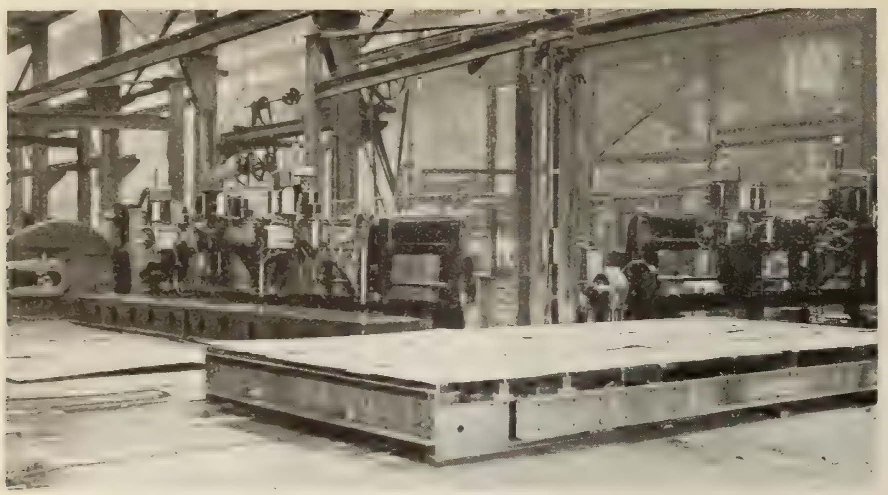
Adjoining the machine shop is the erecting shop 182 ft. wide by 120 ft. long, served by two electric traveling cranes, one being of 20 tons capacity, and one of 150 tons capacity. This shop has eight erecting pits and one testing pit and thoroughfare, giving a capacity of nine to ten large locomotives in process of erection at one time. Three tracks run from the erecting shop into the running shed which is 123 ft. long by 65 ft. wide. This shop will hold nine large locomotives under steam at one time. Adjustable smoke jacks have been installed through which is induced by means of an exhaust fan the smoke from locomotives under immediate test.

The pattern and carpenter shops are together in a two-storey brick building 65 ft. wide by 111 ft. long. Back of this building is the pattern storage house, a single storey building 65 ft. wide by 98 ft. long.

The Foundry

Southeast and alongside of the machine shop extension is the foundry 280 ft. long by 220 ft. wide, having two cupolas with capacities of 15 and 20 tons per hour respectively. It will be noticed that ample space is provided on either side of the units shown for additional cupolas. The hot air heating system is also clearly indicated, pipes extending down alongside each main column. At the north end of the moulding department for heavy castings is seen one of the hot air distributing units. A large fan operated by a small vertical engine draws its supply of heated air from the chamber at the right, which is provided with steam coils. The moulding floor occupies a space 280 ft. in length and 63 ft. in width, of which a space 42 ft. by 80 ft. is devoted to machine moulding. By referring to the illustrations it will be seen that all large moulding boxes are designed for their particular purpose. Both in this and in the small castings departments, the equipment is of modern and up-to-date design, every facility being provided, also labor-saving apparatus for the rapid and economic production of all classes of locomotive and grey iron castings. Two large ovens are located in the east end of the foundry for drying cylinder and other large cores, each oven being 8 ft. 6 in. wide, 10 ft high, and 34 ft. long, inside measurements. In addition, there are four core ovens, each 8 ft. 6 in. wide, 8 ft. 5 in. high and 23 ft. long, as well as two reel type ovens for small cores, each 60 in. by 70 in. Six overhead traveling cranes serve this department, there being two of 5 tons capacity each, three of 10 tons,

SMITH SHOP, LOOKING NORTH, SHOWING FORGING MACHINE FLOOR.



NORTH END OF BOILER SHOP SHOWING PART OF THE ELECTRICALLY-DRIVEN, HYDRO-PNEUMATIC DRILLS FOR DRILLING RIVET HOLES.

and one of 20 tons. The controlling cage in most cases is located at the middle of the crane, as this position permits the operator a clearer view of all sections of the floor, and offers increased facilities for locating the ladle and heavy moulding boxes. In addition to the travelling cranes, the heavy casting department is equipped with a number of wall cranes, one being located at every other main column. These swinging cranes are provided with one-ton Peerless chain blocks. Owing to the severe weather conditions prevailing in Montreal in winter, all foundry supplies are kept under cover in a large supply storage room adjacent to the main bay and convenient to the charging floor. Such materials as moulding sand, coke, pig iron and scrap are housed therein. The charging floor is served from the storage room by means of skips handled by a 10 ton electric traveling crane.

The various materials are taken as required from the supply in the storage department, loaded into skips and elevated to the extended section of the charging floor shown in the upper right hand corner of the storage bay. The skips, which are constructed of sheet steel and steel angle, are so designed that when placed on the tracks, the flanged edges prevent them from slipping when the load is discharged from the tilting platform located in front of the charging door of the cupola.

Power Plant

Owing to the abundance of hydro-electric power in the Province of Quebec, a large part of the electrical energy required is purchased, but a power-house is provided, conveniently situated for economical distribution to all the departments. The boiler equipment consists of six water-tube boilers of 250 horse-power, each fitted with superheaters, arranged in three batteries. The boilers have automatic underfeed stokers and induced draft. Overhead are two coal hoppers, each of 20 tons capacity, from which pipes lead to the automatic stokers. The coal is hauled upon a trestle to the top of the building and dumped into a coal breaker from which it drops into the bins. The engine room equipment includes one cross-compound Corliss condensing engine of 600 horse-power belted to a 400-kilowatt generator; one 710 horse-power motor generator set; and three air compressors having a total capacity of 6,000 cubic feet per minute, which maintain an air line pressure of 100 lbs. per sq. inch distributed to all departments. There is also located in this building a 1,000 gallon per minute Underwriter fire pump.

NEW GREY IRON FOUNDRY, NORTH END OF MOLDING FLOOR FOR HEAVY CASTINGS.

NEW GREY IRON FOUNDRY, STORAGE BAY FOR RAW MATERIALS SHOWING CHARGING FLOOR UNDER RIGHT-HAND END OF TRAVELING CRANE.

Water Supply

The water supply for drinking purposes is taken from a drilled well 500 ft. in depth, and is distributed throughout the works by a steam-driven deep-well pump. All the roof drainage, the overflow from the condensers, hot-well,

EAST HALF OF SOUTH BAY, SHOWING NEW TRUCK AND CYLINDER SHOP.

etc., drain into a reservoir of 300,000 gallons capacity. On the river bank are located two 2-stage centrifugal pumps, each having a capacity of 600 gallons per minute, connected to the distribution mains and the reservoir. Ordinarily they keep the reservoir full, but in emergencies can pump direct into the fire-protection service. The 1,000 gallon Underwriter pump in the power-house takes its supply from this reservoir and distributes the water about the works. There is also a 50,000 gallon tank elevated on a steel tower 100 feet in height directly connected with the mains and upon which the sprinkler system depends for a steady supply and head. It should be noted that all of the shops are fully equipped with automatic sprinklers.

Locomotive Production

A complete system of gauges and templets is in force by which parts of locomotives of the same class are made in duplicate and interchangeable. The plant is equipped to build locomotives regardless of type or size. At present the works have a capacity of about 460 locomotives per year, the latter having an average weight of 200,000 pounds each. In addition to the locomotive output this company also builds a rotary snow plow, which has a high reputation for handling deep snow.

* * *

SOME INTERESTING FIGURES

DURING the past year the C.P.R. received from passengers $24,690,652; from freight, $89,654,405; from sleeping cars, express, telegraphs, and miscellaneous, $13,752,260.

The transportation expenses came to $38,915,381; maintenance of way and structures, $14,071,791; maintenance of equipment, $16,695,955; traffic expenses, $21,798,699; parlor and sleeping car expenses, $990,410; expenses of lake and river steamers, $829,811; general expenses, $4,014,753; commercial telegraphs, $1,339,161.

The number of passengers carried one mile was 1,255,561,198, as compared with 1,164,488,630 last year. Tons of freight carried one mile, 14,050,685,773. Last year the C.P.R. carried 126,909,828 bushels of grain; this year it carried 276,788,209 bushels.

NEW GREY IRON FOUNDRY, SOUTH END OF MACHINE MOLDING FLOOR.

With such an army of workers, the pension figures of the C.P.R. are always interesting. Last fiscal year there was $240,222 distributed to retired employes all over the system. This money is forwarded in cheques to the place of residence. It comes as regular as clockwork. It costs the recipient nothing. There are, as the annual report just to hand shows, 60 on the pension rolls under 60 years of age; 445 between 60 and 70, and 329 over 70, making a total of 834 enjoying pensions. The amount which the company contributed during the last fiscal year was $125,000. There is a balance of $585,548 up to the end of the present fiscal year.

ERECTING SHOP FROM WEST END, LOOKING EAST.

HOW TO GET EXPORT TRADE

THE manufacturer who proposes to enter some sphere of export trade must at least have a general knowledge of the conditions under which same should be sought and catered for. He should be in a position to determine clearly what classes of buyers exist so as to choose definitely on which of them it will be best to concentrate his selling efforts. More than that, he must learn what different forms his selling efforts must take, and also what forms he must avoid, says the Exporter's Handbook.

Concentration and Specialization

The manufacturer must make up his mind definitely, for good or ill, which branch of the export trade he will enter. It will be useless for him to think that he can safely snap up orders from any and every direction, attempting to supply all markets through all channels, yet concentrating on none. System, and a certain conservative adherence to the apparently arbitrary conditions which exist, are essential. The established order of things—call it a congerie of vested interests or what you like, cannot be defied with impunity, not only because those vested interests are powerful, but because they are the interests of every section of the shipping trade, and not merely of privileged groups or individuals, being based on vital business necessities, and not on selfish monopolistic grounds at all. The insistence on indents from the great colonial and other established markets going solely through the hands of merchant-shippers or commission buyers is a case in point.

Organisation of Export Department

The manufacturer must decide to create a properly organised export department, to be run by an expert untroubled by considerations of home trade, and to have an equal call on the service of the factory with that exercised by the home sales department. Above all, the export department should be given full and constant consideration, and not treated in an opportunist spirit as a mere adjunct or a non-essential speculation, to be pushed or neglected at convenience, or to be subservient to the exigencies of the home trade.

Special Treatment Feature

The markets to be catered for must be definitely selected, and for sound reasons in each case. The world generally is not prepared to accept and adopt the standard requirements of any particular nationality product or products. Each market rightly insists, and will do so increasingly in the future, on having its own particular tastes and requirements specially catered for; therefore, a manufacturer will not be justified in allowing his export ambitions to expand unduly on the strength of selling a good article. It is useless to say that what is good enough for the home trade ought to be in favour anywhere else in the world. The wise policy is to discover what oversea markets a particular firm's products are most suited for, and its facilities for production, most easily adaptable to, and to confine attention to those markets. Indeed, a sound rule for the beginner in export trade is to select one market only, and to work it thoroughly, not necessarily refusing shipper's orders for other destinations, but consistently directing the active catering and selling policy to the satisfaction of the chosen market. That is a system which can easily be extended as circumstances require, whereas to diffuse uninstructed energy over all markets, and to hit the mark in none, is a course of action which deliberately invites failure.

Export Salesmanship

There is the modus operandi of export salesmanship to be studied. The indenter abroad must be discreetly canvassed without antagonising the home merchant and buying houses upon whom the financial responsibility for the business rests. This work, as has been shown, depends upon the employment of one or more various types of selling agents, and it is in the selection of and relations with, these that many manufacturers make their worst and most costly mistakes. Much patience and care must be exercised in finding the right firms or individuals and, indeed, the building up of a successful agency system abroad often involves a series of disappointing failures, though persistence always ends in a satisfactory and permanent appointment or appointments being made.

Further, the entire onus of showing results should not be thrown upon the agent when appointed. It is futile to expect him to create business if not vigorously and intelligently supported by his principals. He can do nothing unless he has the right goods to sell, and unless his customers can rely on having their representations, complaints and instructions to him promptly and properly attended to by the manufacturer with whose interests he has been entrusted. In fact special vigilence should be displayed by the manufacturer in seeing that the distant overseas representative is not ignored and neglected for the benefit of the firm's home travellers, who, being on the spot, can make their demands on the factory and dispatching room, more clamorous and insistent.

A keen and experienced representative is required in London, and probably in other centres, to get confirmation from the shipping and buying houses of t largest possible percentage of t orders notified by the overseas rep sentative , and also to be alert to pi up any open orders that may be offer. It is a gross mistake to suppo as so many firms appear to do, that under-paid junior will do this work.

Manufacturer's Personal Interest Vi

Finally it remains for the manuf turer himself to take a keen perso interest in his export business, to pu it by advertising and other gene means, to utilise to the full such offic assistance as may be available, and the earliest convenient moment to ma a personal tour of investigation in market or markets he is serving. It an invariable experience that the pearance on the scene of operations the principal of a manufacturing fi does more than anything else to stir late and encourage agents, to consolid relations with importers, and, not le important to bring about an intellig and vitalised treatment of shipp orders in the factory and office after return home. These in outline are guiding principles to be followed establishing an export connection th will be worth while.

* * *

GRAND TRUNK PACIFIC BRIDG

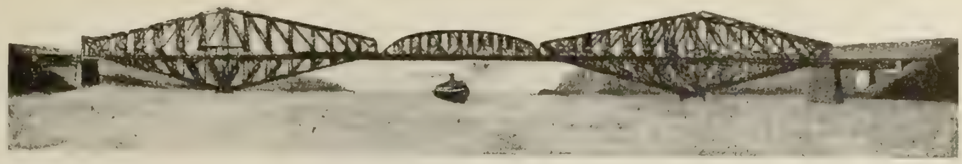
A FEATURE of the Grand Trunk cific Railroad is the series of splen bridges on the line are on the pra pert—65, to be exact. In other wor there are 5.4 miles of steel bridging that vast stretch. Three of the larg bridge on the line are on the pra section, these being South Saskatc wan Bridge at Saskatoon, 150 feet l and 71 feet high; Battle River Bri 5,410 feet long, including approacl and 190 feet high; and Clover Ri Bridge, over the North Saskatchev River, 1,653 feet long and 138 feet hi There are also three bridges on mountain division, over 1,000 feet length, namely, McLeod River Bri 1,055 feet long and 116 feet high; Schiswap Crossing, 1,030 feet long 190 feet high; Fraser River, Fou Crossing, 2,,650 feet long and 36 high.

The highest bridge on the systen that over Pembina River, 860 miles fr Winnipeg, 208 feet high. The Fr River is crossed four times, steel bric being at miles 1073, 1189, 1233, 1276 from Winnipeg. The roadbed the system is 18 feet wide, with r weighing 80 pounds per yard. The dients through the mountains are aln as easy as the prairies themselves. W these outstanding features, the sys is equipped to secure a remarkable gree of efficiency.

NEW QUEBEC BRIDGE

"MAKING ENDS MEET"

STAFF ARTICLE



It will be noted from what follows that most elaborate detail arrangements have been made to ensure success in the operation now imminent of linking-up through its ultimate member the highway of steel which will connect the North and South shores of the St. Lawrence River just west of Quebec City. May wind and tide harmonize with the human element and thereby render less onerous the normally stupendous nature of the task.

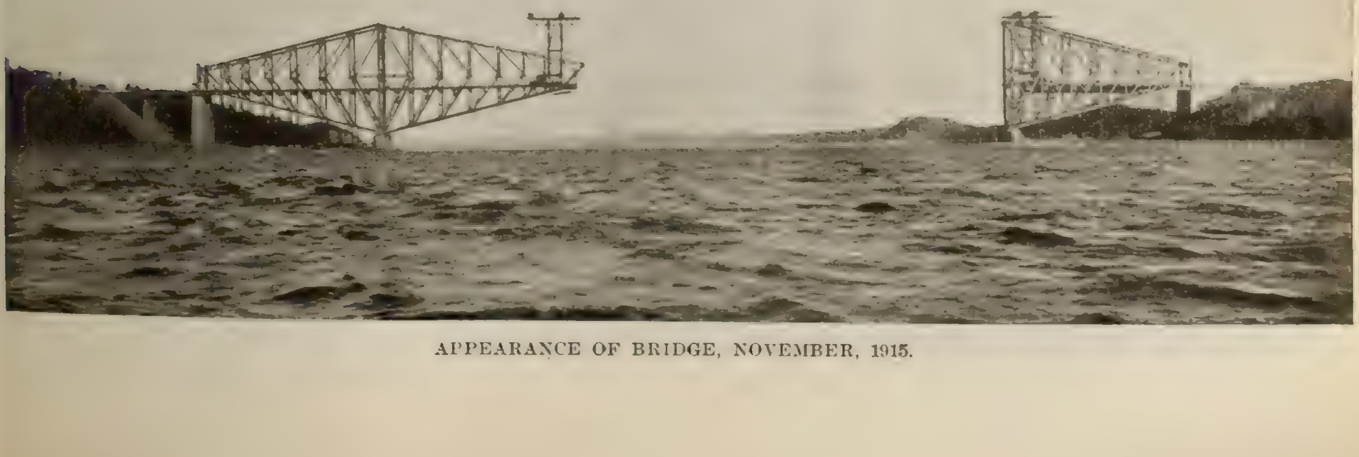
THE Quebec Bridge, one of the greatest engineering feats of its kind in the history of bridge construction, is fast approaching successful completion. The placing of the centre span, which is expected to be one of the most interesting and important features in connection with the entire structure, is awaited with deep interest by the engineering fraternity the world over, the hoisting and connecting of this middle section being conceded as marking the culmination of engineering achievement in the spanning of marine highways.

During the season of 1915, the North shore truss was entirely completed, the false work removed, and the travelling crane dismantled and transprted to the site where the centre or suspended span was to be erected. Simultaneously with the erection of the North shore cantilever arm, the South shore anchor arm was being put together. In order to insure accurate alignment of the two sections of the bridge, calculations and observations were taken at stated periods of construction; same constituting essential factors in connection with this huge and world-unique undertaking.

1916 Operations.

During the winter months, the fabricated material for the suspended span was finished in the works of the St. Lawrence Bridge Co., who are the contractors for the construction and erection of the bridge. About the first of April, 1916, operations were started on the river arm of the South shore section, which was practically completed about the first of August. The actual working days were 92, about 27 days being lost from inclement weather, Sundays, and Legal Holidays. An average gang of 200 men was constantly employed during this period. The total weight of steel placed in position this season amounts to about 13,000 tons; which, with that contained in the suspended span, will total approximately 19,000 tons. Owing to the experience gained on the North shore section, the work this season has been accomplished in 25 per cent. less time than the corresponding work of last year; as a result, erection has progressed so rapidly that the South shore section has been finished one month ahead of schedule time. Fig. 1 shows the South shore cantilever as it appeared on August 6, with the travelling crane still in position; it being used for the placing of the mooring frame and hoisting equipment.

For the past four or five weeks, workmen have been engaged in installing the mechanical equipment and other apparatus required for the floating of the span and the hoisting of same to its final position between the two cantilever trusses. While the date for floating the span has been arranged for September 11, the actual day on which the supreme operation will take place will depend largely, if not entirely, upon weather conditions. The St. Lawrence River, at the bridge site, has a current of six or eight miles an hour, and a twelve to sixteen foot tide, therefore it is essential, that a time be selected—at high tide, when the wind is not excessive; weather disturbances would naturally



APPEARANCE OF BRIDGE, NOVEMBER, 1915.

increase the already known contingencies of tide and current. The hour of proposed floating has been set for between four and five in the morning, at which time the tide is most favorable. This will also give a long day for the operation, and, in order to prevent interruption, the Department of Marine and Fisheries, Ottawa, have issued notices to the shipping interests, that river traffic will be suspended on that date.

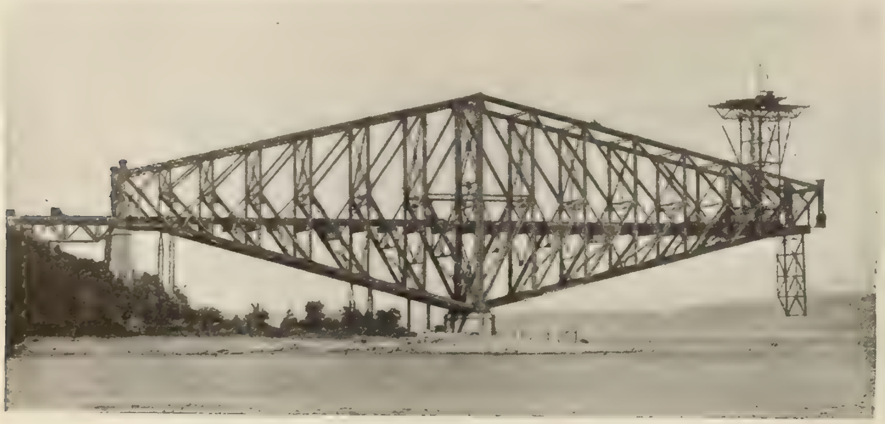


FIG. 1. SOUTH SHORE CANTILEVER, AUG. 6, 1916.

Centre Span Construction

Work on the construction of the centre span, which has a length of 640 feet, a width of 88 feet, a height at the centre of 110 feet, and weighs approximately 5,500 tons floated, commenced about the middle of April of this year, and was completed during the latter part of July. The site chosen for building the span was at Sillery Cove, about three miles below the point at which the bridge is being erected. Following the construction of the temporary approach, the actual work on the span was started; the false work and flooring with the lower side members being placed in position as the crane travelled outward. The upper side and top members were erected as the crane returned to the shore end of the structure. Fig 2 shows the span as it appeared on July 25, just prior to completion. Fig. 3, taken on August 7, shows a large portion of the false work removed; the outer end of the span resting on the steel towers at either corner of the structure, with the pontoons being placed in position. At the time of writing, the remaining false work has been taken out and preparations are almost completed in readiness for the supreme hour when the pontoons will be permitted to raise the structure from the four corner supports.

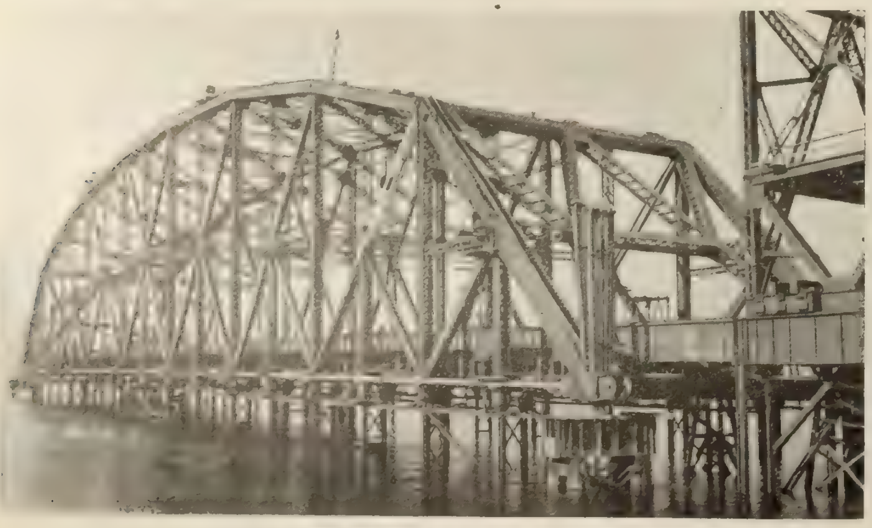

FIG. 2. CENTRE SPAN, JULY 25, 1916.

Pontoon Features

The pontoons, three of which will be placed at either end of the span, are 165 feet long, 32 feet wide, and have a depth of 11½ feet. These are so constructed that the air tight compartments can fill and empty of water with the rise and fall of the tide, but, when desired, can be entirely drained at low tide, and, when the valves—one for each compartment—are closed, the rising tide will cause the scows to take the weight of the span and elevate it from its meantime resting place. This operation, however, will not be accomplished until a definite time of floating has been decided on. When all final arrangements have been determined, tugs will be provided, to tow the floated structure to the middle of the stream.

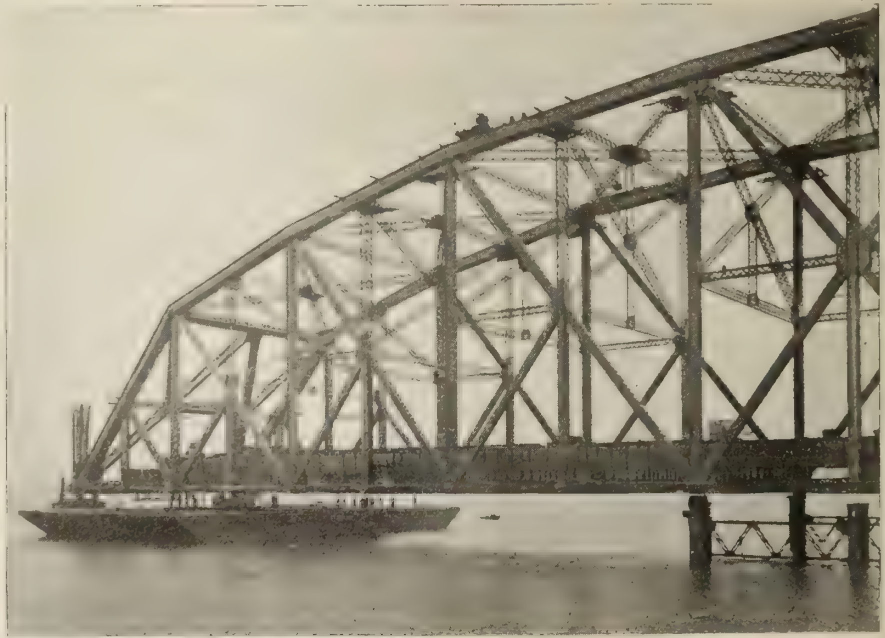

FIG. 3. OUTER END OF CENTRE SPAN SHOWING PONTOONS BEING PLACED IN POSITION.

The tugs however, will not be required to tow the central span up the river, as the flow of the incoming tide is considered sufficient to float the scows with the structure to its position at the bridge. The chief duty of the tugs will be to guide the suspended span during its passage up the river and to hold it stationary, while being secured to the mooring frames. It is this feature of the proceedings that necessitates moderate weather conditions for the successful locating of the span. The exposed area is so great that even a light wind would add greatly to the natural difficulties already mentioned. Once the floating structure is secured to the mooring frames, one of which is shown suspended from the outer end of either truss, the danger from the various elements is largely eliminated, as the mooring device is so designed as to withstand the effects of the highest winds.

Raising the Centre Span

The method adopted for elevating the central span, from the pontoons to its final position is by means of eight 1,000 ton hydraulic jacks, two of which are located at each corner of both cantilever arms and supported on specially designed girders hung from the upper chord of each main structure. On the lower end of these hangers there is a special fixed girder which contains two hydraulic jacks, the plungers of the latter pressing against the moveable girder located directly above. The arrangement of the mechanism is such that the lifting strain is always on the lower member of the supporting girder, being taken directly through the connecting pins when in a stationary position; and indirectly through the jack when the weight is being raised.

The working lift of the jacks is two feet. Three holes for the 12-inch diameter locking pins are located 24 inches apart in the special girders; the corresponding holes in the hanger chains being placed six feet apart; this provides for a lift of 2 feet at each operation of the jacks. The hanger chains, made in thirty foot lengths, are composed of two plates 30 inches wide and 2¼ inches thick. With calculations based on a start being made at full tide, the 70 cycles required to lift the span 140 feet are expected to take about 16 consecutive hours of actual operation. The exact time is, however, only problematical, as it is altogether dependable upon the speed at which the hydraulic pumps can be operated by compressed air, with the addition of other possible contingencies.

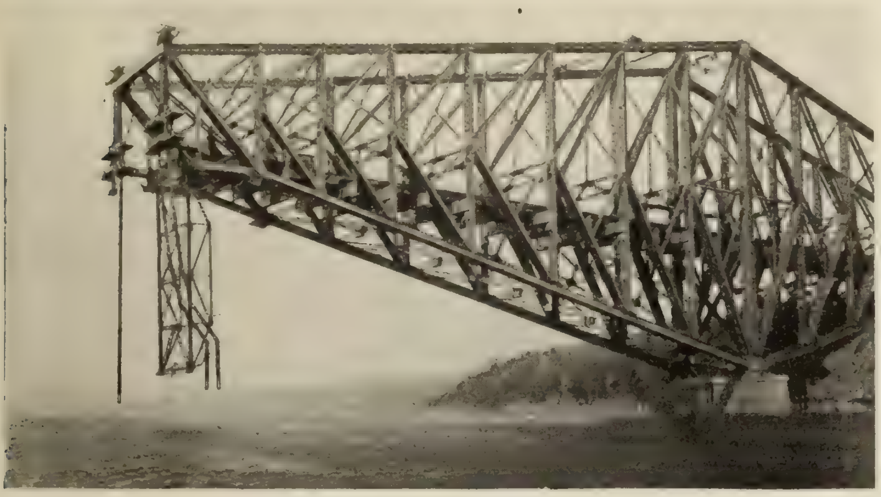

FIG. 4. NORTH SHORE CANTILEVER WITH CENTRE SPAN LIFTING APPARATUS AT OUTER END.

Emergency Provisions

To provide for any emergency through the possible failure of any of the hydraulic jacks, etc., large screw jacks are located on the inner side of each supporting girder. These screw jacks, each 12 inches in diameter, are not used to facilitate the elevation of the suspended span, but are for the purpose of constant adjustment by hand to the increasing space, as each separate lifting operation progresses. As shown in the various illustrations, platforms are constructed adjacent to the link connections for the workmen aperating the locking pins and emergency jacks.

Power Equipment

The hydraulic equipment, necessary for the operation of the lifting jacks is located at the outer end of each cantilever arm. The cylinders of the jacks are made of steel castings 22 inches inside diameter, and an outside diameter of 33½ inches, with rams of chilled cast iron. The pumps are of direct acting plunger type, and are operated by compressed air, supplied by compressors located on the shore at either end of the main approach. The air is delivered to the pumps at a pressure of 100 lbs. per square inch; the pump cylinders are 18 inches in diameter, and the water plungers of 2 inches diameter. Pumps, jacks, and all piping connections have been tested to 5,000 pounds pressure, but the actual working pressure is not expected to exceed 4,000 pounds per square inch. The installation is so designed that a uniform pressure will be

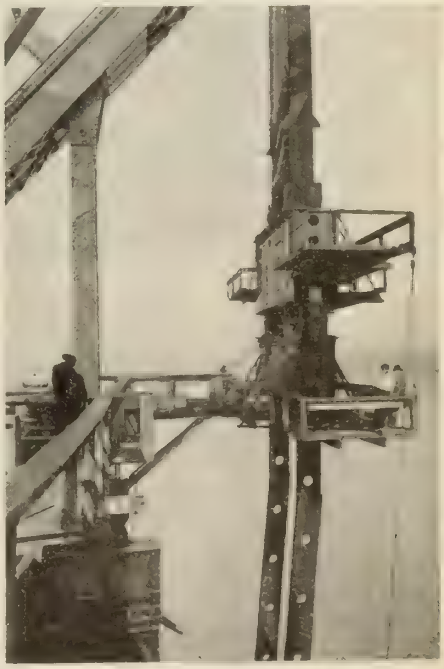

FIG. 6. JACKING GIRDERS, HANGER CHAINS AND LIFTING JACKS.

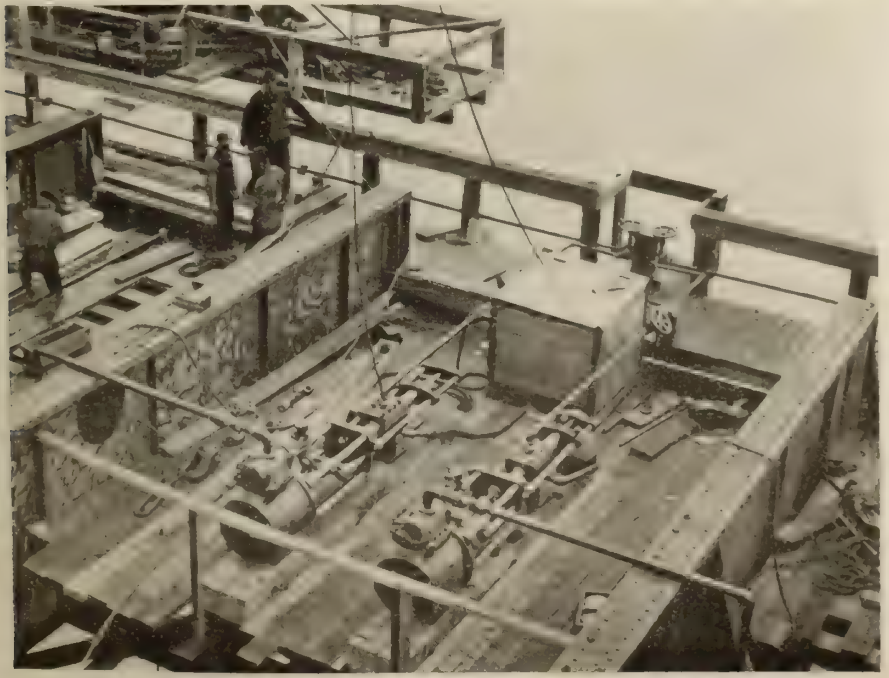

FIG. 5. HYDRAULIC PUMPS AND PIPE LINE TO LIFTING JACKS.

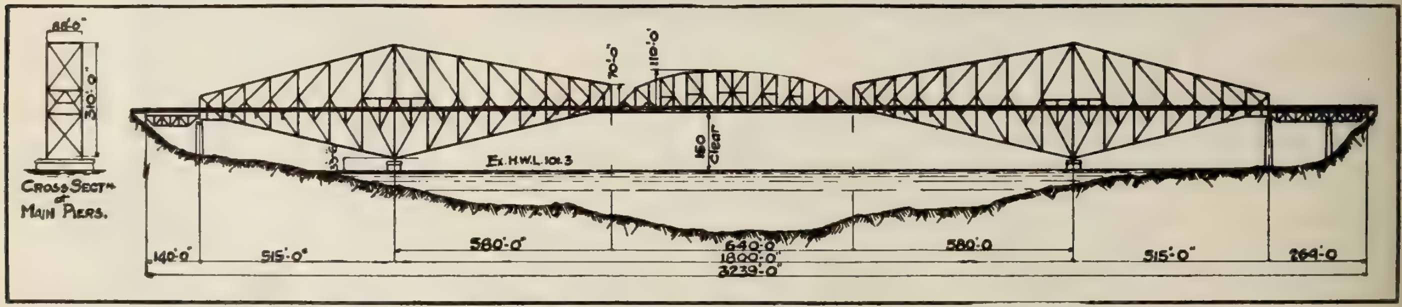
maintained upon all four cylinders, to insure equalization of stress at the various points of support. Provision, however, is made by an ample installation of balanced valves in the pipe line to control any particular unit.

General Observation

When the suspended span is in position, the total weight of steel in the bridge will be approximately 65,000 tons, 55,000 tons being fabricated material. Owing to the climate conditions, and the wide range of temperature between midwinter and midsummer, which is from 130 to 150 degrees F., about 30 inches has been allowed for expansion and contraction in the total length of the bridge.

It is difficult to conceive the magnitude of this great undertaking. To appreciate the many problems of design and construction, it is necessary to have viewed the various component parts while erection was proceeding.

The design, construction and erection of this bridge form one of the great engineering achievements of modern times, and the official opening of this imposing and wonderful structure, which will take place early in 1917, will mark the completion of the last link in an unbroken Canadian railroad highway, which will extend from ocean to ocean. A noteworthy feature of the work which reflects much credit upon the engineers in charge, has been the immunity from accident during erection. From the nature of the undertaking, many minor casualties were to be expected, but the number of fatalities has been surprisingly few; only one being recorded during the past season. A boatman has been kept constantly in the river, immediately below the bridge, for rescue purposes should necessity arise. The efforts of the company to provide comfortable and attractive camp life for the men, have met with deserved success, the special arrangements made having doubtless exerted a restraining and beneficial influence on the workmen in the matter of exercising more than ordinary care in the performance of their varied and hazardous duties.



SKELETON VIEW OF QUEBEC BRIDGE, SHOWING PRINCIPAL DIMENSIONS.

The work has been carried out under the supervision of a Board of Engineers composed of Messrs. C. N. Monserrat (chairman and chief engineer), Ralph Modjeska, and H. P. Borden. The St. Lawrence Bridge Co. are the contractors for the superstructure; George F. Porter, engineer of construction; W. B. Fortune, superintendent of erection; and S. P. Mitchell, consulting engineer of erection.

Observation Facilities.

Owing to the limited space on the bridge and the necessity of keeping that portion of the river in which the tugs will be operating clear of all vessels not engaged upon the work, no one will be allowed upon the bridge who is not engaged in the placing of the span, nor will any steamers, small boats, or other craft be allowed within a considerable distance of the span being floated until it is suspended from the links by which it will be hoisted.

There will be ample space open to the public close to the bridge on the South shore and on the North shore from about half a mile below the bridge as far as Sillery Cove, where the suspened span has been erected. All of these view points are, however, so far removed from the actual work that it will be impossible to see any of the details of the mechanism or more than the general operation of floating and hoisting. At the suggestion of the officers of the St. Lawrence Bridge Co., the Council of the Canadian Society of Civil Engineers has arranged a special excursion for the 8th and 9th of September, when all the arrangements will be completed, and when the members of the society will be afforded every opportunity to see the details of the arrangements and be given an explanation of the proposed operations.

It is felt that in this way those engineers who are resident in Quebec, or who can spend a few days there, will have a much better appreciation of the actual operations than if these were only seen from a distance for the first time, and that those engineers who are only able to spend a short time in Quebec will get an opportunity of examining the structure and the mechanism that would not be practicable if they were only there at the time it is being floated. The St. Lawrence Bridge Co. will provide transportation from Quebec to the site, and it is hoped that arrangements can be made for a special train from Montreal to Quebec. Fuller details of the programme will be announced later.

OUT FOR WORLD MARKETS

THE outline plan for the National Trade and Commerce Convention of Canadian Business Men, called by Sir George Foster, Minister of Trade and Commerce, for October or November, has been prepared, and the Department is now communicating with Boards of Trade all over the Dominion asking them to appoint committees to give the matter consideration. Letters are being also sent to Canadians abroad requesting their co-operation in the work of the Convention, which involves serious consideration of the industrial and commercial problems with which Canada will be faced at the termination of the war.

The memorandum which has been prepared for submission to business men all over the Dominion preparatory to the conference, assumes two standpoints from which the problems before the business interests of the country may be studied. The first of these will take account of the various factors which enter into the upbuilding of trade, such as market opportunities at home and abroad, credit information and banking facilities, commercial training, transportation facilities, labor, immigration, industrial equipment, and the study of raw materials; and, secondly, the various class of goods to the production of which the country naturally or specifically lends itself. It is suggested that committees of business men be appointed and assigned to certain definite problems, developing same from each of these viewpoints.

* * *

The results of the silent victory of the British navy are voiced by Rutledge Rutherford, the American economist and writer, who has recently toured Germany. He says: "(German) shipping is paralyzed, and in all the harbors there are great ships—passenger boats and freighters—being devoured by rust. The great free port of Hamburg . . . looks like a city of the dead."

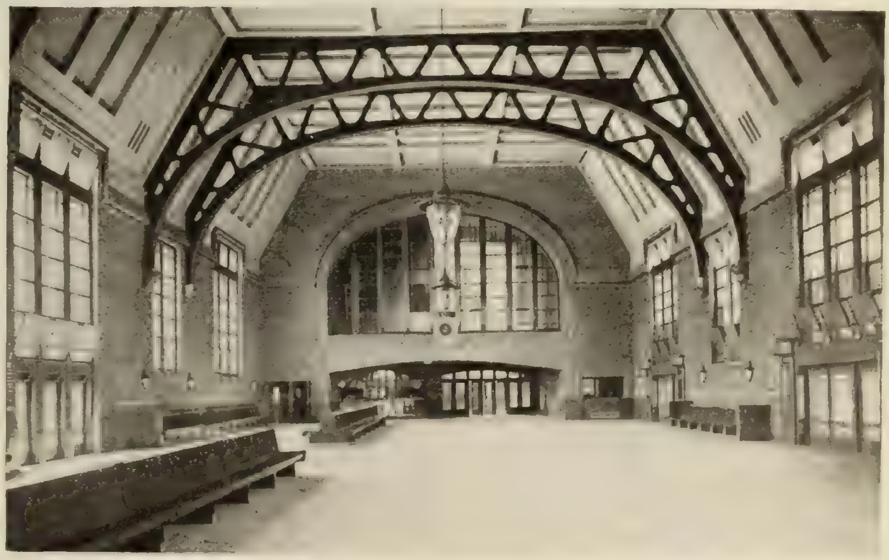
New Station of the Canadian Pacific Railway at Quebec

By C. T. R.

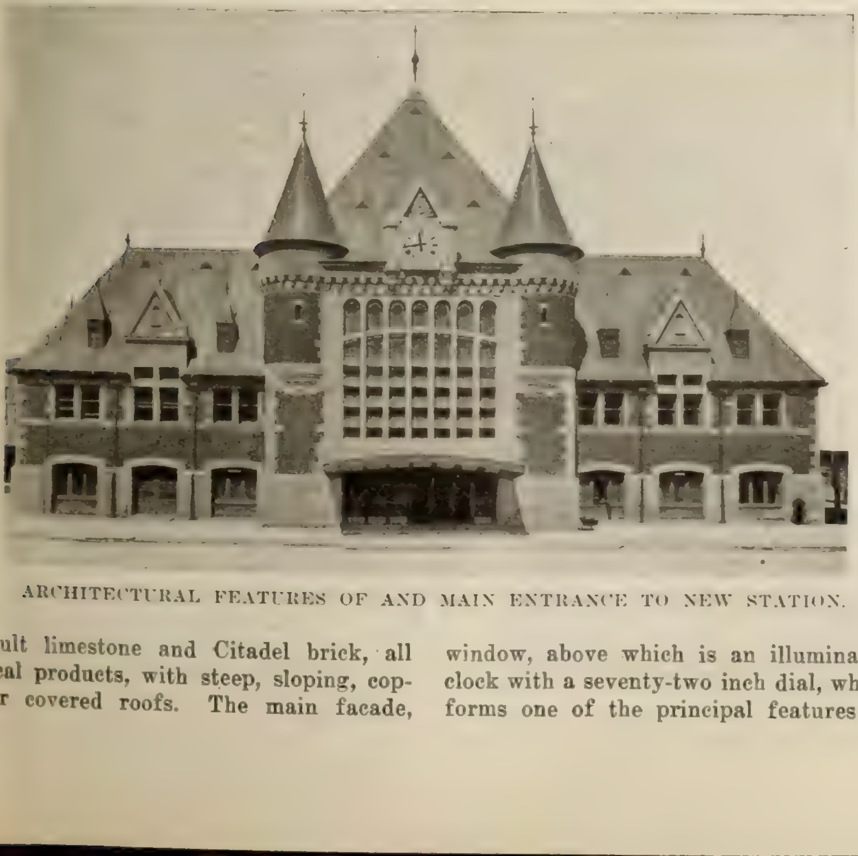
The management of the Canadian Pacific Railroad is nothing if not progressive. Whether in anticipating or grasping opportunity, and giving the latter practical application or scope, it matters little. The growth and development of this big institution has been spectacular in many ways, yet accomplishment has been secured with an absence of loud display. Betterment with regard to employees' welfare, modern, effective, and comfortable rolling stock, efficient public service, attractive en route and terminal buildings and equipment, indicate some outstanding factors which have contributed to the high international reputation of the system. The new terminal depot at Quebec enhances the latter still further.

THE new C.P.R. station at Quebec, which was declared open last month, by the Mayor of Quebec is a triumph of modern railway station construction, besides being admirably located at the corner of St. Paul and Henderson Street just north of the old station. The latter will be removed to make room for the plaza, 350 ft. by 285 ft., which will form an attractive foreground with a large grass plot planted with shrubs and a sixty-foot roadway, flanked by sidewalks, planting spaces, Lombardy poplars, ornamental lighting standards, and two ornamental flagpoles. There will be thus transformed a once ugly portion of the city to a beauty spot which will not only be appreciated by the residents of Quebec, but will give the visitor a favorable first impression of the city.

The station building, which consists of a central block with two wings, is a modern adaption of the old French Chateau Style of architecture and admirably harmonizes with and helps to perpetuate the quaintness and historic traditions of the city. The exterior is faced with Argenteuil granite, Deschambault limestone and Citadel brick, all local products, with steep, sloping, copper covered roofs. The main facade, which faces the plaza, is dominated by a central motif containing the main entrance and is flanked by two tourelles and protected by a glass and iron marquise the full width of the sidewalk. Over the main entrance is a large window, above which is an illuminated clock with a seventy-two inch dial, which forms one of the principal features of the facade. The pediment over the clock bears the arms of the City of Quebec.



THE ATTRACTIVE AND SPACIOUS CONCOURSE.



ARCHITECTURAL FEATURES OF AND MAIN ENTRANCE TO NEW STATION.

In plan, the building is L shaped, the main block being 142 ft. x 65 ft., the concourse wing extending along Henderson Street, 142 ft. x 65 ft., and the baggage and express wing parallel to St. Paul Street, 130 ft. x 44 ft. Entering the building through the 24 ft., wide main entrance and vestibule, one is agreeably impressed with the spacious, light, ticket lobby, 45 ft. wide x 65 ft. long, which rises to a height of 60 feet. This lobby is finished through the medium of grey tapestry brick walls with Lepanto marble base, faience cornices, cartouches and balustrades, and sloping mosaic ceiling with leaded glass ceiling lights, the rich colorings of the faience and leaded glass lending an attractive tone to the decorations. The faience clock dial set in the balustrade at the first floor level with its flanking lion and unicorn is a feature of the room.

On the right side of the ticket lobby are the information wicket, four ticket wickets, the entrance to the women's rest room, and the news stand. On the left, are the baggage and parcel checking counters, customs office, public telephone booths and telegraph counter, while the Transfer Company's office opens off the entrance vestibule. Opposite the main entrance is a series of seven doors opening into the concourse.

The Concourse

The concourse, 125 ft. long x 62 ft. wide, and 40 ft. high, is similarly finished with grey brick walls, having faience inserts, marble wainscot, faience cornices and tinted ceiling, while the huge iron trusses, elliptical in form, which support the roof, spring from ornamental faience cartouches. On the left side of the concourse three sets of gates open to the midway and track platforms. On either side of each gateway is a mechanical indicator which shows the track number, time and destination of the departing trains. A massive train bulletin board has been provided on which the time of arrival of all incoming trains will be posted, while glass-covered bulletin boards have been provided for special announcements and posters.

On the right hand side of the concourse is an exit to Henderson Street, while at each end is a handsome faience dial clock. Comfortable seats have been provided, as the concourse serves also as the main waiting room of the station. The men's smoking room and lavatories are located at the North or far end of the concourse wing. The women's rest room is attractively furnished with rugs, table, chairs, and couch, and is conveniently located and easily reached from both the ticket and lobby concourse. The smoking room and women's room are wainscotted with wood panelling and the lavatories with marble. A feature of the lavatories are the pay toilets and dressing rooms which are provided with all the accessories necessary for the comfort of the traveller and equipped with coin locks which automatically operate by the insertion of a ten-cent piece.

A CORNER OF THE WOMEN'S REST ROOM.

Baggage and Express Arrangements

Ample accommodation is provided for handling the baggage and express matter in a separate wing which has a covered trucking platform on each side. Everything necessary for the comfort and convenience of the travelling public, as well as the efficient operation of the train service, has been installed. The second floor of the main building, which is reached by a stairway from the main entrance vestibule, is devoted principally to the Company's offices and a museum in which an interesting and instructive exhibit of Canada's natural resources will be open to the public. The office corridors and museums surround the ticket lobby and are separated therefrom by open arches and balustrades which afford a splendid view of the lobby as well as provide an abundance of light and air. Rooms for conductors and trainmen with stairway direct from the midway are also provided on this floor. The decorative scheme of the interior is simple and artistic. The motifs in the richy-colored faience depict and symbolize emblems of our national life, and the Tudor rose, shamrock, thistle, fleur de lys, dolphin and trident are freely used and interwined. The ceiling light over the ticket lobby contains the provincial shields and a map of the North American continent showing the Canadian Pacific Railway lines from coast to coast. The large window over the main entrance, which helps to light the ticket lobby contains the arms of the seven great men of Canadian history, viz —Montmagny, the first Governor of Canada—1636-1647; DeTracy, Viceroy of Canada—1665; Beauharnois, Governor of Canada—1726-1747; Montcalm and Wolfe, the famous French and English generals whose names are familiar to all; Frontenac, Governor of Canada— 1672; and Talon, the first Intendant of New France—1665-1672.

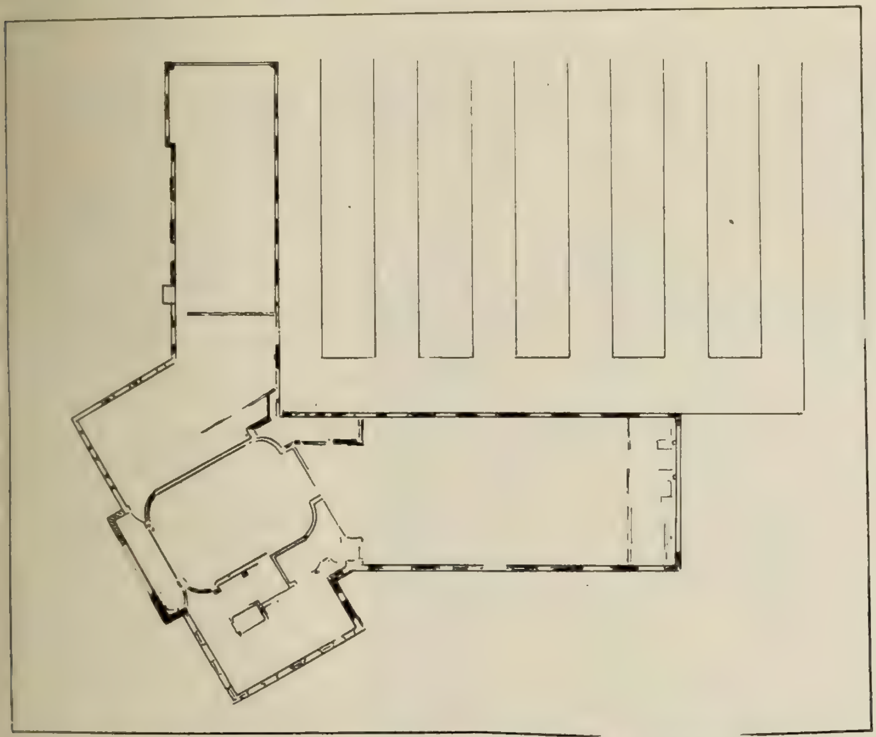
EXPRESS AND BAGGAGE DEPARTMENT ACCOMMODATION.

Materials of Construction

The building was designed by H. E. Prindle, architect, of Montreal, and erected by the Downing Cook Co. of Montreal, under the supervision of D. H. Mapes, Engineer of Buildings of the C.P.R. In the construction of the building, which rests on 430 concrete piles, 400 tons of structural steel, 2,000 yards of reinforced concrete, 400,000 common brick, 75,000 exterior face brick, 125,000 interior face brick, and 10,000 cubic feet of exterior cut-stone, were used. Local labor and materials have been employed wherever possible. The concrete pile foundations were driven by the McArthur Pedestal Pile Co.; the structural work was furnished and erected by the Eastern Canada Steel Co.; the exterior face brick were made by the Citadel Brick Co.; the granite came from the Argenteuil quarries and the limestone from the Deschambault quarries. The interior marble and terrazzo work was done by the Missisquoi Marble Co.; the ornamental iron by the Dominion Architectural Iron Works. The plumbing and heating were installed by Vandry and Matte, the electrical work by the L. K. Comstock Co., and the clocks by the Self Winding Clock Co.

The woodwork throughout, of which, however, there is but little, is

Canadian birch, the railway company having recently adopted the policy of using Canadian woods exclusively for the finish of its buildings and cars. While the Station is the dominating feature of the improvements made by the Canadian Pacific, notice should be taken of the new freight office building and sheds constructed north of the station last year, the new power house located just west of the station and the re-arrangement of the coach yard, all of which has been done on the same comprehensive sale as, and in keeping with, the station building. Quebec can well be proud of its new station, which in design, finish and appointments is second to none in Canada.



SKELETON PLAN OF STATION BUILDING AND RAILROAD TRACKS.

The Opening Ceremony

A notable company, representative of the political, commercial and industrial life of Quebec Province, was present when the new station was formally opened, on August 10, by Mayor Lavigueur. Before the actual ceremony took place, several hundred ladies and gentlemen gathered at the station and proceeded to inspect the same.

After luncheon had been partaken of, A. D. MacTier, general manager of the C.P.R., and chairman of the meeting, made a few remarks regarding the auspicious occasion. The growing business, he observed, demanded this new structure, which he knew would be acceptable to the Quebec people, and the company had always stood willing to meet the people of Quebec in every way. The station was a proof of the latter. He asked the mayor to accept a silver key as a souvenir of the occasion, a souvenir which might be regarded as a link uniting the city to the company.

His Worship the Mayor, in formally declaring the station open, made a happy little speech, in which he referred to the energy and prescience of the C.P.R., which was always ready to be in advance of the times. It was incumbent that it should have the necessary facilities to handle the overseas business which now showed such promise of increase. The C.P.R. had not failed to take note of what was happening. It did not exist for sentiment, but for commercial considerations. Yet it had a long vision; it had patriotism; it had ambition, and it was not afraid of large things. He praised such men as Lord Shaughnessy, Mr. MacTier, and Mr. Wanklyn, who believed in doing things and were not timid about taking opportunity by the hand. He concluded: "Remember, the C.P.R. wants to make dividends, but it also wants to develop the country, and all concerned should be pleased with the outcome in this particular direction."

The Hon. J. D. Reid, Acting Minister of Railways and Canals, said he was delighted to notice that the business interest of the city and Province of Quebec were growing—that the Province was prosperous, and that the city was being provided with additional railway facilities. The Government had not been remiss in this matter. It had operated the Transcontinental, and when the bridge was finished there would be closer relations with the lower provinces, as there would be a direct connection across the continent. The Government had done much in the building of new wharves and docks on the riverfront to facilitate trade, and he could assure them that everything possible would be done by the Government to aid in the success of Quebec, which was now a most progressive city, and had considerably added to its manufactures in the last few years.

J. Picard, ex-president of the Quebec Board of Trade, followed with some interesting remarks, referring to the difficulties and hardships of the early times in Quebec, when communications were crude and slight and people had to put up with privations they could not think of to-day. He made a vivid contrast between that time and the present and gave great credit to the C.P.R. for what it had done in the interval. Of course, there was the initiative and energy of the people to be considered. They were living in times when efficiency was the primary note in business, and when it was necessary to put the shoulder to the wheel, using every facility.

The concluding speech was made by Sir Lomer Gouin, Premier of the Province, who aroused enthusiasm by enumerating the activities of the C.P.R., and especially the large governmental action which resulted in the building of the Transcontinental.

F. L. Wanklyn, of the C.P.R. Executive, followed, with a few brief remarks appropriate to the occasion.

Those Present.

Those present included: A. D. MacTier, general manager Canadian Pacific Railway, who presided; Mayor Lavigueur and Madame Lavigueur, Hon. T. Chase Casgrain, Hon. L. A. Taschereau, Minister of Quebec Public Works; Hon. N. Perodeau, M.L.C.; D. O. Lesperance, chairman of the Quebec Harbor Commission; Hon. Dr. J. D. Reid, Minister of Customs and Acting Minister of Railways; Madame Casgrain, Sir Lomer Gouin, Premier of Quebec, and Lady Gouin, Hon. J. C. Kaine, Hon. George McCorkill, F. L. Wanklyn, executive assistant to the president of the C.P.R.; A. W. Campbell, R. B. Fraser, Mr. and Mrs. H. E. Pringle, Montreal; Mr. and Mrs. Dowling Cook, T. B. Ross, W. M. Dobell, M. Bancroft, O. W. Bedard, vice-president of the Quebec Board of Trade; T. Levasseur, Jas Picard, representing the Quebec Board of Trade; A. O. Gravel, St. George Boswell, Rev. A. S. Love, Hon. J. B. Caron, Minister of Agriculture; Sir George Garneau, J. B. Chouinard, Capt. Emile Trudel, Capt. P. Hamel, G. Madden, Duncan Robertson, Col. H. H. McLean, Lt.-Col. Fages, Lt.-Col. Chabot, Lt.-Col. Lafferty, Lt.-Elliott, Hon. Sir F. X. Lemieux

Vol. XVI. SEPTEMBER 7, 1916 No. 10

PAPER SHORTAGE AND COST EFFECTS

THE publishing business in Canada and elsewhere is facing a serious crisis. Since the first of the present year there has been a growing scarcity of paper and a corresponding advance all along the line in prices. During that period the best grades of paper—white coated, have gone up fifty per cent. A medium grade of coated paper which cost 6 cents per pound previously cannot now be bought for less than 9 cents; and the mills are dodging orders at any price. Super-calender paper which formerly sold at from $4.35 to $4.50 is now quoted anywhere from $7.00 to $8.25. Newsprint—the rough surfaced paper on which newspapers are printed—has advanced nearly fifty per cent. Many of the best grades of paper have been taken off the market altogether, the manufacturers finding it impossible to keep up the quality. There is, in fact, a very general depreciation in paper quality despite the staggering jump in prices, and, notwithstanding the latter, manufacturers are being compelled to refuse business or to defer shipments for long periods.

Eliminating Non-Essential Matter

This condition is operating in two directions in its bearing on the publishing business. It is forcing publishers to economize on paper in every conceivable way. They are finding it necessary to reduce the number of pages printed. Lavish supplements, containing features whose scope of appeal is limited, have had to be excised. "Extras" are put out only when the news really warrants it. Newspapers, magazines, class papers, are all concentrating on the important problem of printing the really essential matter in the least space and eliminating all non-essentials. In this one respect, the paper shortage will prove a blessing in disguise. Publishers are examining their mailing lists closely, cutting off unprofitable "exchanges" and "dead heads" and are doing everything in their power to economize in other similar directions. In these days of scarcity only the man who wants his paper sufficiently and is willing and ready to pay for it promptly should get his copy.

Increased Subscription Rates

The situation is reacting in another direction. It is forcing publishers to raise their subscription rates; many newspapers and class publications have already done so. Subscription rates in Canada have, in the past, been hammered down to a more or less ridiculous minimum by strenuous competition, but now it is clearly impossible for publishers to continue to supply their product at such low prices in face of the sudden advance of paper cost.

The reader should bear the foregoing facts in mind. If he is inclined to complain when his favorite periodical comes to him a little thinner, and when his renewal notice quotes a higher figure, let him pause to consider that it is only by such measures that the publisher is able to continue to send him the paper at all.

RAILROAD DEVELOPMENT AND ITS EQUIPMENT MANUFACTURE

THE present issue of Canadian Machinery features in its editorial contents in a more than usually comprehensive manner, the large place that railroad progress and development fill in making available Canada's agricultural and mineral wealth. Incidentally, there is given probably equal prominence to its kindred aspect—her commercial and industrial enterprise. Of our four leading articles, two of these deal specifically with manufacturing plants and their equipment for the production of railroad rolling stock—cars and locomotives of every type and for every service; a third demonstrates the stupendous nature of the work which has occasionally to be undertaken to enable the "laying of steel" where it will best serve a predetermined purpose, while a fourth gives unquestionable evidence that there must needs be adequate and modern terminal facilities if the en route equipment is to secure its proper measure of patronage—both freight and passenger.

Larger Business in Sight

The now imminent spanning of the St. Lawrence by what is known as the New Quebec Bridge, naturally claims the larger share of popular interest at the moment, because marking the culmination of a Canadian engineering achievement which will command world-wide repute. In view, however, of the already available and yet to be secured opportunities to manufacture for export trade, the reader cannot otherwise than be impressed with the idea that the locomotive and car building plants illustrated and described in this issue are admirably planned and equipped for such eventualities. As a result of the opening to traffic of the New Quebec Bridge early in 1917, there is sure to develop an increased demand for rolling stock, comprising locomotives and cars. That the National Steel Car Co., and the Montreal Locomotive Works are prepared to take care of a still further domestic requirement and at the same time that arising from sources abroad is, we think, a quite justifiable conclusion to be reached from a perusal of the data presented.

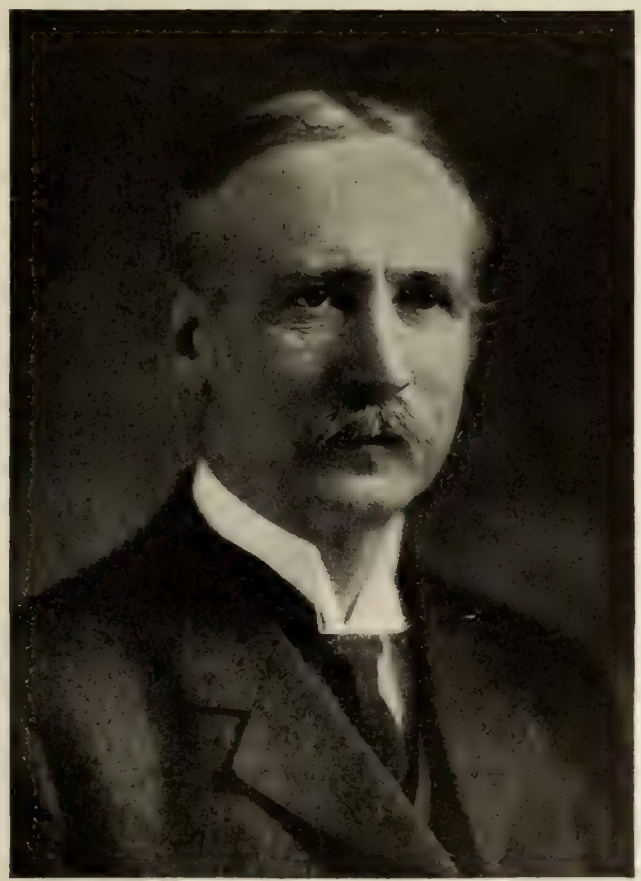
* * *

Thanksgiving Day has, by an Order in Council, been definitely fixed for Monday, October 9.

INDUSTRIAL NOTABILITIES

GEORGE HERRICK DUGGAN, vice-president and general manager, Dominion Bridge Co., Montreal, Que.; chief engineer, St. Lawrence Bridge Co. (contractors for steel work, new Quebec Bridge); vice-president, Montreal Ammunition Co.; president, Dominion Copper Products Co.; director, Montreal Trust Co.; director, Hillcrest Collieries, Ltd.; director, Royal Bank of Canada; was born at Toronto Sept. 6, 1862, only son of the late John Duggan, Q.C., and Amelia (Tulloh) Duggan. He was educated at Upper Canada College and in the School of Practical Science, Toronto University (1883), taking the post-graduate course in 1884.

Entering on a business career by joining the engineering department of the C.P.R. during the year 1884, Mr. Duggan, in the interval right up to the present, has held not a few specially responsible as well as publicly prominent appointments with a number of leading Canadian engineering and allied corporations and enterprises. Enumeration of several of these follows: Engineering department Dominion Bridge Co., 1886-1901; chief engineer, 1891-1901; assistant to president and consulting engineer, Dominion Steel Co. and Dominion Coal Co., 1902-1903; second vice-president and general manager, Dominion Coal Co., 1904-10; present position since 1910.



GEORGE HERRICK DUGGAN.

He is a member, The Institution of Civil Engineers, England; member and president, Canadian Society of Civil Engineers; member American Society Civil Engineers; member Canadian Mining Instituton (vice-president, 1906, councillor, 1911-1913); one of the founders Toronto and Royal St. Lawrence Yacht Clubs; amateur yacht designer, designed and sailed winners "Seawanaka" International Cup, 1896-1901; captain, Toronto Yacht Club, 1883-1884; commodore, Royal Cape Breton Yacht Squadron, 1905-1910; commodore, Royal St. Lawrence Yacht Club, 1889-1890; honorary commodore, 1915-1916.

He was awarded Royal Humane Society's Bronze Medal and Certificate, 1893. It has been said that "he carries as much sporting blood in him as can safely be carried by a man who must temper sport with business."

Mr. Duggan married Mildred Scarth, daughter of Pilans Stevenson, Montreal, October, 1888, there being two sons and one daughter of the union. One of his sons, H. S. Duggan, R.E., was killed in action Oct. 21, 1915. His clubs are the Mount Royal, St. James, Engineers, Forest and Stream, and University (Montreal); Royal Canadian Yacht (Toronto); Royal Cape Breton Yacht (Sydney); Royal St. Lawrence Yacht and Garrison (Quebec). In religion Mr. Duggan is Anglican. His residence is 120 McTavish Street, Montreal, Que. —Photo courtesy International Press.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Sept. 4, 1916.—Industrial and commercial interests have been somewhat disturbed, owing to the unsettled condition arising out of the possible tie up of American railroads. The strike, if it should go into effect, would not only dislocate United States trade. but would seriously affect conditions in this country. The situation in the war zone is gradually assuming a stage where the future outlook is much more encouraging. although an early ending seems very improbable. Industrial conditions continue to indicate the prosperous condition of Canadian trade, with domestic activities showing continual improvement.

Steel

The possibility of an extensive strike upon the railroads throughout the United States has placed the market in an unsettled condition, and efforts have been made to provide material for the steel mills to continue operations. If, however, the strike should materialize, which at the moment is still difficult to determine, it would place the producers in a serious position, as the supply of raw materials would soon become exhausted. Theembargoes, placed on several roads, will not be lifted until some satisfactory settlement has been made between the contending parties. The past week has been featureless in regard to price changes, and the market is quiet pen the outcome of the present indust unrest. The demands for all classes o steel and iron products is heavy, and in many respects the quirements are greatly in excess of supply. Local dealers report a q situation, but showing uneasiness o the labor situation.

Metals

With the exception of copper, t metal situation is unchanged. The g- eral market has been affected by t developments of the railroad strike, embargoes have been placed upon ma of the roads, which will continue un the situation warrants them being lift . Copper has stiffened considerably, ow g to the impending placing of large exp t orders. The demand for tin has beco e lighter. Spelter is showing anoth r weak spell, with declining prices. Le d is very quiet. Antimony is dull a d weak.

Copper.—The market at present s very firm, owing to the report that ne- tiations for large tonnage, on extend delivery, have been under considerati for some time. Actual contracts ha not yet been made, as producers ha been asking stiffer prices on the streng of this additional business, with the r sult that prospective buyers have te- porarily withdrawn from the mark . The situation is likewise being affect by the unsettled condition of transpo- tation facilities. As most of the lar consumers are well covered for imm diate requirements, they can afford await the outcome of the present cris London reports the standard situation little easier, with a decline of £1 on sp and £2 on futures. Electro is strong on a £1 advance. New York continu very firm, with market quotations nor inal at 27½c for prime lake, 25¼c f castings, and 28c for electrolytic; th latter showing a decline of ¼c p pound. Local dealers report a very fir market, with quotations unchanged 31c for lake and electrolytic, and 30c f castings.

Tin.—No special developments ar noted in the week's tin market, and th situation is practically unchanged. I the absence of heavy buying, stocks ar accumulating and a weaker tendency being shown. The London situation i unchanged, with a slight falling off i quotations on futures. The New Yor market is firm, showing a ⅛c advanc but little business is being done. Th quotation this week is 38⅞c per pound Local dealers have advanced their price 1c, and are now quoting 44c per pound

Spelter.—All efforts to place the spel- ter upon a better footing seem to hav failed, as the fluctuations of the pas four or five weeks have apparently show that a return to its high position of few months ago will be long delayed

The demand, which of late has given rise to the expectation of renewed activity in spelter, has never continued long enough to indicate a return to former interest. The situation has, therefore, developed into one of apparent dullness, with dealers and consumers showing little interest in the market. London reports show a decline in spelter prices, spot having declined £6 and futures £2. New York, on a decline of ¾c, is quoting 8 4-5c per pound. Local dealers are still quoting 14c on a quiet market.

Lead.—No activity is shown in lead, and the market is very dull. Owing to the falling off in demand, the independents are inclined to lower their quotations. The trade is, however, awaiting the outcome of the labor situation, and nothing can be said until some understanding is arrived at. London is a little stronger, while New York is quiet, but firm. The situation here is practically unchanged, although dealers are asking 8¾c, an advance of ¼c per pound.

Antimony.—The market at present is very dull and the demand very light. In an effort to make sales, some dealers are reported to have offered metal at low figures, but the only result has been to weaken the general market. The reported orders for additional shrapnel have created a little interest, and indications point to a steadier market. A decline of 1¼c on the New York market has lowered the quotation to 12½c. The situation here is quiet and unchanged, with prices firm at 17c per pound.

Aluminum.—No change is reported, and quotations are firm at 68c per pound.

Machine Tools and Supplies

The requirements of the munition makers, in regard to machine tools, have reached a stage where the demand is only for individual tools to supplement their present equipment. Tool builders are, however kept fairly busy, but delivery is much better; in fact, almost normal. The quantity of re-sale machinery is constantly increasing, owing to some of the plants having completed their orders on the smaller shells. The demand for small tools and machine supplies continues very heavy.

Scrap

The market has taken on increased activity, and the demand is good; dealers reporting fair business. Old and scrap copper has been advanced ¼c per pound, quotations running from 16¼c for light and 19¼c for heavy. An advance of ¼c has been placed on machine turnings and compositions, the former being quoted at 12¾c and the latter at 14¾c. Brass clippings and turnings show a similar increase, being 13¾c and 12¼c respectively. Scrap zinc at 7¾c shows an advance of ¼c per pound. Aluminum is now 35c, an advance of 1c per pound.

Toronto, Ont., Sept. 5.—The situation in manufacturing circles continues satisfactory and the outlook is favorable as regards getting business, although the shortage of labor and probably further increase in cost of raw materials are causing considerable anxiety among manufacturers. While production is being curtailed on this account, business continues to expand, which is proved by the marked increase in railway earnings, trade returns, bank clearings ,etc. The increases shown each month reveal the substantial and progressive improvement in the industrial situation. The Customs returns for August, recently issued, show an increase of $3,610,000, the total revenue for the month being $11,941,000. The returns each month have shown increases, which are indicative of the phenomenal expansion in trade.

The threatened railway strike in the United States, which would have had far-reaching effects, even in Canada, has fortunately been averted. Embargoes had already been placed on shipments to United States points, but were withdrawn a few hours after the notice had been issued. The local freight yards are already sufficiently congested without any further troubles. The first week of the Canadian National Exhibition has been a great success, being favored with exceptionally fine weather. The exhibits in the Machinery Hall are well up to previous years, while the exhibit of munitions in the Educational Building is a new feature which has proved both interesting and instructive, particularly to the general public.

CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion $100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the commission headquarters are at Ottawa.

Steel

The steel trade continues extremely active, with an increase in production, now that the weather has become cooler. The demand for steel is, and will continue to be for many months, so great that the steel mills are assured of capacity business for some time to come. The steel companies are devoting themselves principally to the manufacture of steel for munitions and other war material, with the result that domestic trade has suffered and deliveries consequently have fallen behind. On this account some consumers have had to defer buying, and work is being held up pending a return to more normal conditions. Several buildings have been delayed, and some held up indefinitely owing to the difficulty of getting steel. There are no price changes to note this week, but the market continues very firm, and further advances in steel products may be looked for. Boiler tubes and plates are firm at the advance announced last week, and deliveries are as backward as ever, owing to the sold-up condition of the mills. The wrought iron pipe situation is unchanged with quotations very firm on both black and galvanized pipe. The high-speed tool steel situation is easier owing to the increase in available supplies of tungsten. The demand for tool steel continues heavy, supplies still being difficult to obtain, although prices have an easier tendency. There has been no further change in prices of steel bars, and present quotations will probably be maintained for some time.

There has been no change during the week in the sheet situation. With the high price and scarcity of sheet bars, prices of sheets have been well maintained, and no decline may be expected for some considerable time. The output of the sheet mills has improved with the cooler weather, but deliveries are still backward. The galvanized sheet situation is more settled following the improved tone in the spelter market, but with the continued high price of black sheets, acids, etc., and also increase in wages, lower prices on galvanized sheets do not appear at all likely in the meantime.

In the United States, production in August was about equal to July, in spite of the hot weather, etc. New business, however, was larger, and at the end of the month will probably show an increase in unfilled orders. The steel market has been active during the past week with the buying of large amounts of rails, car plates and general steel products. Export business continues large, while the domestic demand is also heavier. Prices on all steel products are very firm, with no changes of importance to note.

Pig Iron

There is nothing of particular importance to note in the pig iron market this week, and quotations are unchanged The heavy demand for steel-making pig iron continues, and the consumption this year will break all previous records. An indication of the heavy consumption of pig iron in the United States and Canada is shown in the iron ore shipments on the Great Lakes, which for August created a record. In August there were loaded 9,850,140 tons, which was nearly two million tons greater than for the corresponding month last year.

Machine Tools

The machine tool market continues active, the situation being practically the same as during the past few weeks. The demand is still confined almost entirely to tools for munition plants, although there is fair inquiry for toolmakers' equipment. Reference has previously been made to the fact that American machine tool houses have to pay a war tax on profits arising out of business transacted in Great Britain. Large concerns, however, say that this will not cause them to close their branch offices in Great Britain, as they will be useful in looking after business previously booked as well as that placed in the future.

Supplies

The increase in cost of raw materials has resulted in a tendency to higher prices on practically all steel and brass goods, some lines having already been affected. Shurley & Dietrich hand saws now carry a discount of 15 per cent. Those saws, which were formerly 25 per cent., are now 13 per cent., while lines that used to be 30 per cent., now carry a discount of 21½ per cent.; canvas belting has advanced, the new discount being 50 and 10 per cent. Carpenters' chalk has advanced, due to the difficulty of getting chalk from England, and also the high cost of dyes for the colored chalks. Turpentine is unchanged, but linseed oil has declined, and is now quoted at 86c for raw and 89c for boiled oil per gallon.

Metals

Quotations on most metals have been well maintained, particularly copper, which, although unchanged, is strong, with an upward tendency. The demand continues good for metals for munitions, while ordinary business during August was above normal.

Copper.—The market continues strong at unchanged prices, which are still nominal. Domestic buying is improving and the export business continues heavy, but it is reported that the enormous sales predicted for export recently have not materialized as yet. However, without the large buying for the Allies, which had been expected, practically all available supplies for the remainder of the year have been disposed of. Local quotations are firm at 30c per pound.

Tin.—The market is unsettled and lower in London, but unchanged locally. The local market is quiet, tin being quoted at 44c per pound.

Spelter.—The demand has fallen off, and the market is quieter, with quotations nominal. Local quotations are unchanged at 14c per pound.

Lead.—The market is very dull, and easier. The Trust price of 6.50c New York has been maintained, but the independents' quotations are a shade easier at 6.67½c New York. Local quotations are unchanged at 8½c per pound.

Antimony.—There has been practically no demand for antimony during the week, and the market is stagnant. Quotations, however, are unchanged at 17c per pound.

Aluminum.—The situation in this metal is unchanged. Local quotations, 68c per pound.

⁂

CANADA AND BRITISH WEST INDIES

E. L. PEASE, vice-president and managing director of the Royal Bank of Canada, in a statement to The Financial Post regarding the benefits of closer relations between Canada and the British West Indies, says in part:

"Annexation or some other form of political union would undoubtedly prove very advantageous to both countries. The entire business element and native population of the British West Indies being srongly pro-British, favors the idea. Jamaica did not come into the recent tariff agreement with Canada, owing to fear of the loss of her banana trade with the United States; but if the movement now on foot in Great Britain to increase the production of sugar within the Empire by means of a preference is achieved, little fear of opposition on the part of the West Indies to annexation need be entertained. Owing to the geographical situation, government from this side of the Atlantic would be more practical than from England.

W. I. Trade Neglected

"The trade of the West Indies has been almost criminally neglected in the past. The sugar industry, which at one time was the main industry, nearly suffered extinction, owing to the impossibility of competing with the bounty-fed production of Continental Europe and the preference given to Cuba by the United States. The antiquated mills in use in the West Indies accentuated this condition. Canada, which absorbs their entire production, which was about 200,000 tons last year, revived the industry somewhat by granting a preference two or three years ago. Possessing, however, the elements that would tend to cheap production—namely, a rich soil and cheap labor, it is estimated that the British West Indies are capable of producing 3,000,000 tons per annum, enough to supply the requirements of the United Kingdom. The phenomenal prosperity of Cuba is due to the preferential sugar tariff of the United States. In 1901 Cuba produced about 500,000 tons of sugar; last year she produced 3,000,000 tons. Porto Rico, whose sugars enter free into the United States, produc less than 100,000 tons in 1901, and ov 400,000 tons last year, double the pr duction of the entire British We Indies. The volume of trade of th little island is also in excess of th entire trade of the British West Indie

Mutual Benefit

"Much as the West Indies woul benefit commercially and politically t union with Canada, the advantage would not all lie with that countr The more general interchange of trad that would result would be of incal able benefit to Canada. Last year ou tropical imports exceeded $30,000,00 of which only $6,000,000 came from th West Indies. Canada's exports to th West Indies are steadily increasing, a increased prosperity within the Wes Indies would naturally greatly increas the demand for our exports. At present the exports of fish aggregate £500,000, and our flour has, owing to th preferential tariff largely supplante American flour."

⁂

LACHINE CANAL AUGUST TRAFFIC

WHILE there is a decrease in the amount of wheat, and consequently in the total amount of grain, to come down the Lachine Canal in the past month, when compared with the corresponding month of last year, still there are substantial increases in the amount of produce, coal, number of passengers, and in the number of ships and the total tonnage.

During last month only 1,128,406 bushels of wheat came down the canal, while for the same month last year there were 3,107,618 bushels, a difference of 1,978,212 bushels. This however is largely compensated for by the large increases in other grains. There was an increase of 1,706,116 bushels of oats, 366,000 of corn, 199,740 of barley and 81,000 of rye. The decrease in the amount of all grains for the month is 318,678 bushels, and this added to the decreases for the other months of the present season, make a total decrease of 8,674,761 bushels, compared with the amount for last year.

The decrease it is said, is in part due to the fact that many of the ships in former years were grain have been commandeered by the Government and are at present transporting other commodities; as a result, a large portion of the grain that came down the St. Lawrence for exportation now finds its way to American ports.

No flour was brought down during the past month, but the same is true of August last year. There were 39,873 boxes of cheese, an increase of 7,700 er last year; 1,292 barrels of apples, increase of 924; 1,040 boxes of butr, and increase of 179; and 1,460 cases eggs, a decrease of 469 cases. There s also a substantial increase in the mount of coal to pass down the canal. the past month the total of 277,667 s, compared with 158,710 for August, 15.

There were 1,217 vessel trips made rough the canal in the last month, hich is 101 more than during the same onth last year. The increase in tonage is even more marked last month, aving been 687,037, while a year ago was 589,317. The total number of assengers to come down the canal, or own the Rapids, in the past month was 7,263, which is an increase of 6,910. n the total cargo there is also an inrease, the figures for last month being 38,988, compared with 470,931 for August last year. This year was an inrease in the number of ships to pass hrough the canal light the figure being August, 1916, 406; August, 1915, 69.

* * *

WILL ENLARGE HYDRO SYSTEM

EXTENSIONS and improvements involving an expenditure of well over a million and a quarter dollars are being undertaken by the Provincial Hydro-Electric Commission to meet the ever-increasing demand for Hydro power. The announcement was made recently by Sir Adam Beck and preliminary work is already under way.

Double Transmission Line

The chief item of new work is the doubling of plant and equipment from Dandas to Toronto. Largely to meet the needs of Toronto the Commission has decided to go ahead with the construction of a new double transmission line between Toronto and Dundas, and practically to duplicate the Toronto station—the expenditure being estimated at something over a million dollars. At Dundas the Commission is also practically duplicating the big inter-switching station there at a cost of approximately $250,000. At Niagara Falls new switches and other equipment to handle the 50,000 additional horse-power being secured from the Canadian Niagara Power Co. will be installed.

The first instalment of power received from the Canadian Niagara Co. has now been added to by a second 12,500 h.p., which was taken over within the past week. For the new double line out of Toronto the plans and specifications have been completed and the right of way is being acquired. The new right of way, it is stated, will include sufficient room for the construction of a radial railway between Toronto and Dundas when in the future it is decided to go ahead with it.

Will Link Up Plants

The attention being given the Niagara district does not leave other districts neglected. The Commission undertaking at once the building of two connecting lines in the Owen Sound-Collingwood district to pool the power resources of the four development plants now operated by the Commission there—the Big Chute, Eugenia Falls, Swift Rapids and Wasdell Falls plants.

The Commission is building thirty-five miles of transmission line from Collingwood to tap the Eugenia Falls line to Owen Sound, thus linking up the Falls development with the Big Chute. A six-mile line from Wasdell Falls meeting the Orillia line from the Big Chute completes the circuit. Eugenia Falls has a power surplus of 4,000 h.p., while Wasdell Falls has 1,000 h.p. more than is being used in that district. This surplus gives the Commission almost immediately the added supply needed to serve the municipalities hitherto depending upon the Big Chute, or a total supply from all four developments of 15,000 h.p. The Commission estimates that with the increased development possible at the Big Chute and the developments yet to be made on the Saugeen and Severn Rivers there is an ultimate development in the district of 25,000 h.p. When this is all in use at some future date the northern municipalities can be linked up with the Niagara system by a six-mile line at Forest.

The tremendous increase in consumption is heavy, due to the demand from all over the system. New municipalities are being added, and those already in are increasing consumption steadily. A part of the increase is due to the manufacture of munitions.

* * *

DOMINION BRIDGE CO. SUBSIDIARIES

The Dominion Copper Products Co., one of the two successful subsidiaries organized by the Dominion Bridge Co., since manufacture of munitions was started in Canada, has secured authority to increase its capital from $400,000 to $1,000,000.

Both the Montreal Ammunition Co. and the Dominion Copper Products, organized through the Bridge company to manufacture parts required in shell making, were given a capitalization little more than nominal to the volume of

Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department is able to present the following list of the moreimportant British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

BRAZIL

Bahia, British Consul.
Rio de Janeiro, British Consul General.

CHILE

Valparaiso, British Consul General.

COLOMBIA

Bagota, British Consul General.

ECUADOR

Quito, British Consul General.

EGYPT

Alexandria, British Consul General.

FRANCE

Havre, British Consul General.
Marseilles, British Consul General.

INDIA

Calcutta, Director General of Commercial Intelligence.

ITALY

Genoa, British Consul General.
Milan, British Consul.

MEXICO

Mexico, British Consul General.

NETHERLANDS

Amsterdam, British Consul.

PANAMA

Colon, British Consul.
Panama, British Vice-Consul.

PERU

Lima, British Vice-Consul.

PORTUGAL

Lisbon, British Consul.

RUSSIA

Moscow, British Consul General.
Petrograd, British Consul.
Vladivostock, British Consul.
Odessa, British Consul General.

SPAIN

Barcelona, British Consul General.
Madrid, British Consul.

SWEDEN

Stockholm, British Consul.

SWITZERLAND

Geneva, British Consul.

URUGUAY

Monte Video, British Vice-Consul.

VENEZUELA

Caracas, British Vice-Consul.

business which developed for both concerns. The Ammunition Company started off with a capital of $300,000, but the actual amount of money required to get that enterprise under way is said to have been many times that amount. The Bridge Company, with its strong cash position, was able to finance the advances required in the early days of organization. Latterly the company has built up a remarkably strong cash position of its own.

The Copper Products Co., which was organized some months later, or about a year ago, was also given a low capitalization, but the present increase authorized suggests that it is proposed to make the capitalization approximate more closely to the expenditure that may be made in connection with enlargement of original plans.

MARINE INSURANCE

By E. V. Pannell.

FROM the earliest times cargo-owners and shipowners have recognized the necessity of safeguarding their property against the risks of the sea. In the early days of the Christian Era, when the Phoenicians and Tyrians traded with Spain, Gaul, and Britain, their frail ships were sometimes overtaken by tempests, which could only be ridden out safely by lightening the craft; it, therefore, became customary under extreme stress of weather to jettison a portion of the cargo. The loss thus occasioned was shared equitably by the various cargo-owners, and thus the principle of "General Average" was established. The word "Average" signifies "Damage," and of such, present-day marine insurance recognizes two kinds: "General," implying loss, as above described, by jettison, and "Particular," covering damage due to other causes.

Initiation of Marine Insurance

In the year 1670 a society of shipowners and master marines, meeting at Lloyd's coffee house in Cornhill, London, formed a marine intelligence department, issuing a shipping bulletin three times a week, which exists to-day under the well-known form of Lloyd's list of British and Foreign Shipping. About 100 years later the same society formulated the marine insurance policy which is now in use all over the world. Many other companies besides Lloyd's underwriters are handling marine insurance, but the form of policy and the warranties are practically universal.

Insurance Scope

The scope of insurance has been greatly extended, for, although it was the original intention of marine insurance to cover only the risks of the sea which no skill or care could prevent, policies may now be taken out to cover any conceivable risk. The underwriters have always reserved certain "warranties" or stipulations by which they exclude certain risks. For instance, a clause will be found at the foot of a marine policy stating "Corn, fish, salt, fruit, flour and seed are warranted free from average except general, unless the ship be stranded, sunk, burnt or on fire." Put in other words, this means that the above commodities are excluded from insurance except in the case of jettison or the ship be lost, in which case it is most probable that a total loss could be claimed. The object of the clause is apparent, as the above mentioned articles are peculiarly liable to damage, and hence not a good risk. This is the F.P.A. (free of particular average) clause which normally appears on every policy, but which may by arrangement with the underwriters be over-ridden.

A further warranty states: "Sugar, tobacco, hemp, flax, hides and skins as warranted free from average under five pounds per cent." This was designed to relieve the underwriters from having to settle petty claims for particular average amounting to less than 5 per cent. of the value of the goods insured. A similar clause related to the vessel itself, the limit in this case being 3 per cent. With a large and valuable cargo, 5 per cent. would amount to quite a large sum; it is, therefore, customary for shippers to protect themselves by dividing up the cargo into £100 blocks. By this means damage, which would amount to less than 5 per cent. on the whole cargo, will, if localized, probably reach very much more on the smaller lot, then particular average can be claimed and paid.

Two other warranties which are not mentioned, but are implied in the policy, are "Seaworthiness and Legality." The first covers absence of overloading, proper stowage, efficient manning, absence of cargoes of unusual risk, etc., whilst legality would be affected by the carriage of contraband or the insurance of a foreign vessel against war risks.

Insurance Comparisons

Comparing marine insurance with fire or theft insurance on land, it will be seen that there are certain distinctions. On land, a policy is a contract of indemnity by which the insurance company undertakes to restore the original condition of the property insured. It can hardly be said that marine insurance is of the same nature because there is no burden on the insured to prove the value of the loss, and in many cases it would be impossible to do so. Further, the issue of P.P.I. (policy proof of interest) policies to some extent lends itself to speculation. Nevertheless good faith is essential to the policy, and misrepresentation or concealment immediately render the insurance void. If the misrepresentation is accidental, it is customary to return the premiums otherwise they are forfeit. At the time of taking out the policy, all circumstances liable to influence the underwriters must be divulged, default in this regard being equivalent to concealment.

"Sailing" Clause

Besides the F. P. A. clause and the implied warranties already mentioned there are certain other warranties which are expressed in the policy. One is the warranty to sail on a certain date. To "sail" in this case is to cast off moorings or to weigh anchor and does not necessitate clearing the port. The insurance in this case would cover stranding of the vessel after castings off but before the port was cleared. If, however, the policy contains the words "sail from the port of ———————," the port must be cleared, otherwise the policy is void. This is an important point in war time as it is possible that the ship might be lost by a mine or infernal machine before clearing her port. The F.C.S. (free of capture, seizure, detention and the consequences thereof) clause is one which practically eliminates war risk and therefore in times like the present is usually over-ridden by being omitted or the words "including war risk," inserted in the body of the policy. Warranties sometimes given to the underwriters with the object of securing better rates are "part value uninsured," and "no iron or ore in excess of registered tonnage is carried."

Total Loss

In some cases the insurer will take out a T.L.O. (total loss only) policy thus eliminating particular average. Total loss is of two kinds, actual and constructive. The first applies when:—

(a)—The ship or subject matter is completely destroyed.

(b)—The matter is so damaged as to cease to be the subject of the insurance, "cease to exist in specie."

(c)—The assured is irretrievably deprived of the subject matter.

As an example of (b), a cargo of hides shipped from Valparaiso to Bordeaux were so badly damaged during passage as to putrify. It was, therefore put ashore at Rio as it was claimed that at the journey's end they would cease to exist in specie. Total loss was therefore paid.

Constructive total loss applies more often to the ship than to the cargo. It covers the circumstances where the goods are reasonably abandoned, or where the cost of recovery would exceed the value of the goods. In this case the insured hands to the underwriters a notice of abandonment formally surrendering all interest in the goods and claiming total loss. As a formality, the underwriters usually decline this notice so that same is accompanied with a writ and a formal action is entered for the recovery of T.L. based on the facts at the time of issuing the writ. Upon satisfying the claims the underwriter acquires all the rights of the insured by what is termed subrogation. Such rights may be the result of proceeding already instituted for compensation (in the case of collision), or salvage.

Payment of Insurance

When insurance has to be paid, the necessary investigations and apportionments are made, not by the underwriters themselves, but by an entirely independent body of highly specialized professional men, the average adjustors. Their work is frequently very difficult, particularly where general average is paid. It will easily be seen that if ten thousand dollars worth of a fifty thousand-dollar cargo were jettisoned the adjustment of the average payable by each of the separate shippers is no simple matter. In order to avoid detention of cargo it is usual, where a G.A. has been incurred, for the cargo owners to sign an average bond undertaking to pay their share of the G.A., when it has been computed, and they are called upon. Upon this understanding the cargo is delivered to the consignee. The average bond usually calls for a bank deposit as security. In order to avoid ambiguity as to the laws of general average which vary in different countries, the policy usually specifies that the York-Antwerp rules shall govern both G.A. and salvage. The foreign general average clause over-rides this and stipulates that the laws governing G.A. shall be those of the country of destination.

Period of Insurance

Insurance attaches from the time goods are safely loaded until they are safely landed. The policy is sometimes extended to cover between "shipper's and consignee's" warehouses, and this sometimes involves transfer by lighter or railroad. If insured for "voyage," however, the insurance ceases to attach 24 hours after mooring. Goods are generally insured between specified points or for voyage, but ships are usually covered by time policies for six months or one year.

Certain peculiarities attach to a marine insurance policy. For instance, as already noted, the F. P. A. clause states that average will not be paid except the ship is stranded or lost. However, a rider to the policy asserts that "grounding in the Suez Canal, Manchester Ship Canal, River Plate," and certain other locations "shall not be deemed a stranding." This clause is inserted because it is an everyday occurrence for a ship's keel to touch bottom in these channels.

Marine insurance was originally designed to protect shippers from losses due to the perils of the sea, piracy, restraints or rulers and princes, barratry of the master or crew, and jettison. It is, however, extended in modern times to cover any conceivable risk. Certain liabilities must, however, be undertaken by the shipowner and are accepted by the bill of lading. These are: (a) Improper stowage; (b) Negligence of servants; (c) Pilfering.

The shipowner's liability is limited, and the shipper's only really satisfactory indemnification is afforded by a policy of marine insurance.

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

MARINE INSURANCE

By E. V. Pannell.

FROM the earliest times cargo-owners and shipowners have recognized the necessity of safeguarding their property against the risks of the sea. In the early days of the Christian Era, when the Phoenicians and Tyrians traded with Spain, Gaul, and Britain, their frail ships were sometimes overtaken by tempests, which could only be ridden out safely by lightening the craft; it, therefore, became customary under extreme stress of weather to jettison a portion of the cargo. The loss thus occasioned was shared equitably by the various cargo-owners, and thus the principle of “General Average” was established. The word “Average” signifies “Damage,” and of such, present-day marine insurance recognizes two kinds: “General,” implying loss, as above described, by jettison, and “Particular,” covering damage due to other causes.

Initiation of Marine Insurance

In the year 1670 a society of shipowners and master marines, meeting at Lloyd’s coffee house in Cornhill, London, formed a marine intelligence department, issuing a shipping bulletin three times a week, which exists to-day under the well-known form of Lloyd’s list of British and Foreign Shipping. About 100 years later the same society formulated the marine insurance policy which is now in use all over the world. Many other companies besides Lloyd’s underwriters are handling marine insurance, but the form of policy and the warranties are practically universal.

Insurance Scope

The scope of insurance has been greatly extended, for, although it was the original intention of marine insurance to cover only the risks of the sea which no skill or care could prevent, policies may now be taken out to cover any conceivable risk. The underwriters have always reserved certain “warranties” or stipulations by which they exclude certain risks. For instance, a clause will be found at the foot of a marine policy stating “Corn, fish, salt, fruit, flour and seed are warranted free from average except general, unless the ship be stranded, sunk, burnt or on fire.” Put in other words, this means that the above commodities are excluded from insurance except in the case of jettison or the ship be lost, in which case it is most probable that a total loss could be claimed. The object of the clause is apparent, as the above mentioned articles are peculiarly liable to damage, and hence not a good risk. This is the F.P.A. (free of particular average) clause which normally appears on every policy, but which may by arrangement with the underwriters be over-ridden.

A further warranty states: “Sugar, tobacco, hemp, flax, hides and skins as warranted free from average under five pounds per cent.” This was designed to relieve the underwriters from having to settle petty claims for particular average amounting to less than 5 per cent. of the value of the goods insured. A similar clause related to the vessel itself, the limit in this case being 3 per cent. With a large and valuable cargo, 5 per cent. would amount to quite a large sum; it is, therefore, customary for shippers to protect themselves by dividing up the cargo into £100 blocks. By this means damage, which would amount to less than 5 per cent. on the whole cargo, will, if localized, probably reach very much more on the smaller lot, then particular average can be claimed and paid.

Two other warranties which are not mentioned, but are implied in the policy, are “Seaworthiness and Legality.” The first covers absence of overloading, proper stowage, efficient manning, absence of cargoes of unusual risk, etc., whilst legality would be affected by the carriage of contraband or the insurance of a foreign vessel against war risks.

Insurance Comparisons

Comparing marine insurance with fire or theft insurance on land, it will be seen that there are certain distinctions. On land, a policy is a contract of indemnity by which the insurance company undertakes to restore the original condition of the property insured. It can hardly be said that marine insurance is of the same nature because there is no burden on the insured to prove the value of the loss, and in many cases it would be impossible to do so. Further, the issue of P.P.I. (policy proof of interest) policies to some extent lends itself to speculation. Nevertheless good faith is essential to the policy, and misrepresentation or concealment immediately render the insurance void. If the misrepresentation is accidental, it is customary to return the premiums otherwise they are forfeit. At the time of taking out the policy, all circumstances liable to influence the underwriters must be divulged, default in this regard being equivalent to concealment.

“Sailing” Clause

Besides the F. P. A. clause and the implied warranties already mentioned there are certain other warranties which are expressed in the policy. One is the warranty to sail on a certain date. To “sail” in this case is to cast off moorings or to weigh anchor and does not necessitate clearing the port. The insurance in this case would cover stranding of the vessel after castings off but before the port was cleared. If, however, the policy contains the words “sail from the port of ——————,” the port must be cleared, otherwise the policy is void. This is an important point in war time as it is possible that the ship might be lost by a mine or infernal machine before clearing her port. The F.C.S. (free of capture, seizure, detention and the consequences thereof) clause is one which practically eliminates war risk and therefore in times like the present is usually over-ridden by being omitted or the words “including war risk,” inserted in the body of the policy. Warranties sometimes given to the underwriters with the object of securing better rates are “part value uninsured,” and “no iron or ore in excess of registered tonnage is carried.”

Total Loss

In some cases the insurer will take out a T.L.O. (total loss only) policy thus eliminating particular average. Total loss is of two kinds, actual and constructive. The first applies when:—

(a)—The ship or subject matter is completely destroyed.

(b)—The matter is so damaged as to cease to be the subject of the insurance, “cease to exist in specie.”

(c)—The assured is irretrievably deprived of the subject matter.

As an example of (b), a cargo of hides shipped from Valparaiso to Bordeaux were so badly damaged during passage as to putrify. It was, therefore put ashore at Rio as it was claimed that at the journey’s end they would cease to exist in specie. Total loss was therefore paid.

Constructive total loss applies more often to the ship than to the cargo. It covers the circumstances where the goods are reasonably abandoned, or where the cost of recovery would exceed the value of the goods. In this case the insured hands to the underwriters a notice of abandonment formally surrendering all interest in the goods and claiming total loss. As a formality, the underwriters usually decline this notice so that same is accompanied with a writ and a formal action is entered for the recovery of T.L. based on the facts at the time of issuing the writ. Upon satisfying the claims the underwriter acquires all the rights of the insured by what is termed subrogation. Such rights may be the result of proceeding already instituted for compensation (in the case of collision), or salvage.

Payment of Insurance

When insurance has to be paid, the necessary investigations and apportionments are made, not by the underwriters themselves, but by an entirely independent body of highly specialized professional men, the average adjustors. Their work is frequently very difficult, particularly where general average is paid. It will easily be seen that if ten thousand dollars worth of a fifty thousand-dollar cargo were jettisoned the adjustment of the average payable by each of the separate shippers is no simple matter. In order to avoid detention of cargo it is usual, where a G.A. has been incurred, for the cargo owners to sign an average bond undertaking to pay their share of the G.A., when it has been computed, and they are called upon. Upon this understanding the cargo is delivered to the consignee. The average bond usually calls for a bank deposit as security. In order to avoid ambiguity as to the laws of general average which vary in different countries, the policy usually specifies that the York-Antwerp rules shall govern both G.A. and salvage. The foreign general average clause over-rides this and stipulates that the laws governing G.A. shall be those of the country of destination.

Period of Insurance

Insurance attaches from the time goods are safely loaded until they are safely landed. The policy is sometimes extended to cover between "shipper's and consignee's" warehouses, and this sometimes involves transfer by lighter or railroad. If insured for "voyage," however, the insurance ceases to attach 24 hours after mooring. Goods are generally insured between specified points or for voyage, but ships are usually covered by time policies for six months or one year.

Certain peculiarities attach to a marine insurance policy. For instance, as already noted, the F. P. A. clause states that average will not be paid except the ship is stranded or lost. However, a rider to the policy asserts that "grounding in the Suez Canal, Manchester Ship Canal, River Plate," and certain other locations "shall not be deemed a stranding." This clause is inserted because it is an everyday occurrence for a ship's keel to touch bottom in these channels.

Marine insurance was originally designed to protect shippers from losses due to the perils of the sea, piracy, restraints or rulers and princes, barratry of the master or crew, and jettison. It is, however, extended in modern times to cover any conceivable risk. Certain liabilities must, however, be undertaken by the shipowner and are accepted by the bill of lading. These are: (a) Improper stowage; (b) Negligence of servants; (c) Pilfering.

The shipowner's liability is limited, and the shipper's only really satisfactory indemnification is afforded by a policy of marine insurance.

CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

CANADIAN TRADE COMMISSIONERS.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

Engineering

Chatham, Ont.—The Gray Dort Motor Co. will build an addition to its plant here.

Hanover, Ont.—The Hanover Cement Co., proposes to purchase additional machinery and equipment for its plant.

St. John, N.B.—The new plant which is being built for McAvity & Sons is almost completed and will soon be in operation.

New Westminster, B.C.—The Western Marine Railway Co., has commenced work on the new shipyards on Poplar Island. The plant will cost about $80,000.

Windsor, Ont.—The Maxwell Motor Car Co. expects to start shortly on the erection of a plant to cost $60,000. A site was purchased from the city last spring.

Estevan, Sask.—The Lignite Briquette & Power Co., propose establishing a brick and tile plant. A plant for making briquettes from lignite is also contemplated.

St. John, N.B.—The City Council has decided to proceed with the construction of a power house and laundry of the General Public Hospital at an estimated cost of $46,000.

Welland, Ont.—The Canadian Steel Foundries, Ltd., are building an addition 40 ft. by 100 ft., to the muck bar mill, and will install hydraulic forging presses and gas furnaces.

Orangeville, Ont. — The Canadian Clock Co., propose to build a factory, estimated to cose $30,000, and a by-law will be submitted to authorize a loan of $15,000 to the company.

Port Moody, B.C.—Construction work will be started at once on the erection of a shipbuilding plant for Boyds, Ltd., of Port Moody, to include engineering and wood-working plants, foundry etc.

Sherbrooke, Que.—The Iron & Metal Supply Co., Montreal, propose to erect a factory, at an approximate cost of $15,000. A by-law will be submitted to the ratepayers to sanction certain concessions.

Brantford, Ont.—The contractors have commenced to break ground for the erection of the plant of the Dominion Steel Products Co. The main building, including the office, will be 370 feet by 90 feet. The company has a capital of $500,000.

Fredericton, N.B.—A new pumping station is to be erected at the Experimental Farm to take the place of the station destroyed by fire in March, 1915. The new building is to be two stories high and will cost about $3,000. William Richards has been awarded the contract for the concrete work. J. A. Grisdale, of Ottawa, is Director of Experimental Farms.

Ottawa, Ont.—The contract for the new Dominion Arsenal at Lindsay, Ont., has been awarded to the Westinghouse-Church-Kerr Co., of New York and Montreal. The total cost of the buildings, equipment and plant is not available at the present moment. The estimated cost, however, of the buildings and certain parts of the plant closely associated therewith will be approximately $675,000. The work is being done through this company upon the same basis on which they carry on all their undertakings. The materials and plant are purchased on the tender basis, the contracts going to the lowest tenderer, all of which are submitted for the approval of the proper officials of the Government. The company are allowed a percentage on the total value of the work, the rate varying in accordance with the amount of engineering services employed.

Electrical

Elmwood, Ont.—The Village Council are considering installing a hydro-electric system.

Dundas, Ont.—The Hydro-Electric Commission propose duplicating the equipment at the distributing station here.

Lethbridge, Alta.—On September 15, the ratepayers will vote on a by-law to provide further extensions to the electric light system.

E. P. Coleman, general manager of the Dominion Power & Transmission Co., of Hamilton, Ont., has been elected president of the Canadian Electric Railway Association.

Collingwood, Ont.—The Hydro-Electric transmission line to Eugenia Falls is already in course of construction. The line will be 35 miles in length and will cost at least $4,000 per mile.

Hanover, Ont.—The Light Commission is considering the extension of the existing lighting plant, or, as an alternative, the construction of a new system. Estimates will be got immediately. Chairman, Dr. Mearns.

Brantford, Ont.—The Hydro-Electric Commission will install interswitching apparatus here and also at the Woodstock station. These interswitching stations will break the lines between Dundas and London into three sections. They will eliminate breaks in the service such as have occurred recently.

New Westminster, B.C.—By changing from arc lights to the new nitrogen lamps, the cost of the arc lighting system of the city can be reduced from $12,914 to $4,673, a substantial saving of $8,241. This was the report made tc the City Council in committee by City Electrician Digby. The change was authorized.

General Industrial

St. Jerome, Que.—The Regent Spinners, Ltd., will build a mill here.

Renfrew, Ont.—The Renfrew Textile Co., will build an extension to their factory.

Wingham, Ont.—The Wingham Salt Works will shortly install machinery at their new brine well.

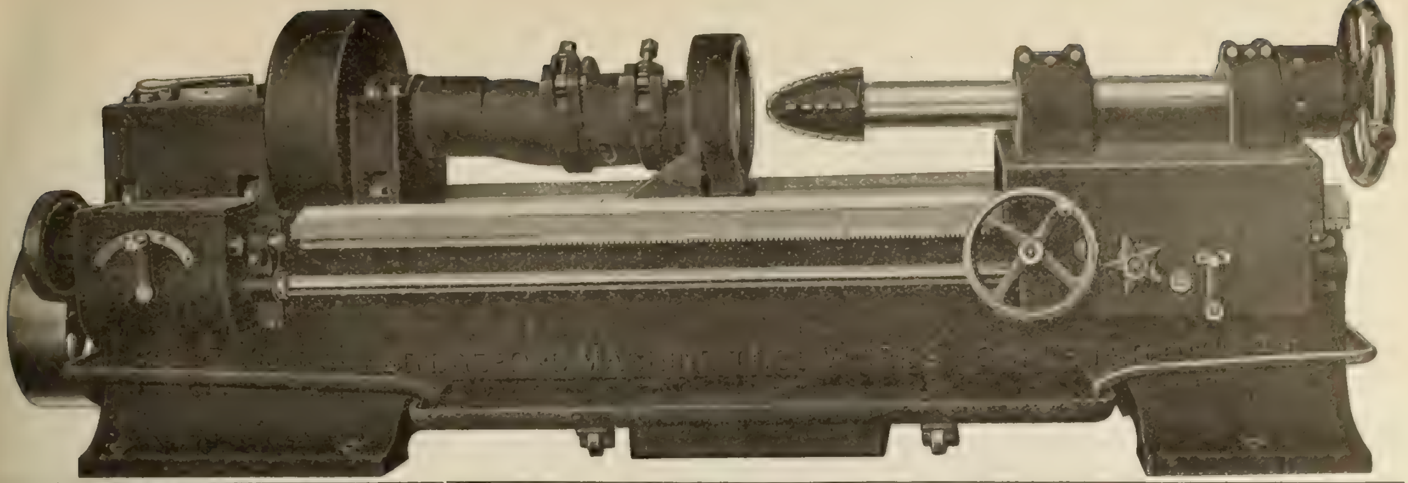
London, Ont.—The Hunt Milling Co. are contemplating the erection of an addition to their flour mill here, to cost $50,000.

Toronto, Ont.—The Corrugated Paper Co., has let a contract for the erection of a brick and steel addition to its plant to cost $12,000.

Medicine Hat, Alta.—It is expected that the new mill being constructed by the Lake of the Woods Milling Co., will be completed this year.

London, Ont.—The Canadian Cereal & Flour Mills Co. propose to erect an addition to their premises on Talbot street, at an estimated cost of $10,000

St. Jerome, Que.—The Canadian Consolidated Rubber Co., will build a large addition to its plant at St. Jerome, Que., and has awarded the contract to Gray & Dunn, Montreal.



Rough Bore, Straight Diameter

Rough Bore, Inside Radius

Finish Bore, Straight Diameter

Finish Bore, Inside Radius

Boring Economy

Two great factors in economic boring operations are the Bridgeford Boring Lathe and the Davis Boring Heads. Combining the massive strength of this Bridgeford Lathe and the tough, superior quality of a specially constructed Boring Head and you have an ideal combination that will save you at least 25 per cent. to 50 per cent. on your Boring operations. The lathe is a machine of ideal proportionate strength, the stresses have been scientifically calculated, the vital points strengthened, resulting in a smooth-running, perfectly balanced unit that ensures efficiency, economy, speed and superior production.

Bridgeford 9.2" Boring Lathe

The lathe is of the heavy duty, low swing type, having a specially designed carriage with auxiliary hand feed for internal profile. Carries a 6 inch steel bar with male taper, allowing for light designs of cutter heads; 3 automobile style speed changes, all running in oil bath. A chip tray is attached and is used in conjunction with stationary lubricant tank. Regular equipment comprises everything except chuck, steady rest and cutter.

Davis Boring Heads

The boring heads are a new construction. Having benefited by the experiences of the "pioneering days" this type of head has been constructed, making a direct cut in the cost of boring operations of 25 per cent. to 50 per cent. Being made of that superior quality high speed steel you will have boring heads that will last, that will prove to you their saving power.

A 25% to 50% saving on boring operations will be welcomed by shell manufacturers. Illustrated here are four boring heads: Rough bore, straight diameter; finish bore, straight diameter; rough bore, inside radius; finish bore, inside radius. These heads may be adapted to any lathe and will give you economical, speedy and efficient service.

Write us for particulars.

The A. R. Williams Machinery Co.
64-66 Front St. W. - Toronto, Ont., Canada

St. Thomas, Ont.—The Neal Bread Co., of London, Ont., will in the near future erect a modern bakery in this city. The location or size of the building was not stated.

London, Ont.—The J. R. Shuttleworth Co., hat manufacturers, are preparing plans for an addition to their factory on Dundas street. The building will be of brick construction and will cost about $10,000.

London, Ont.—The H. S. Hall Co., of Jersey City, have opened factory premises here and will manufacture lisle and chamoisette gloves. The company propose building a factory in the spring at a cost of $25,000, to weave the fabric required in the manufacture of the gloves. Chas. Phillips, of Toronto, represents the company.

Brantford, Ont.—Two Hamilton men will have joint management of the Brantford Carriage Co., which was recently amalgamated with the Baynes Carriage Co., of Hamilton. The managers will be Messrs. McTaggart and Jex, both of the Baynes Co. The stock in trade of the Baynes Co. is now being transferred to this city.

Niagara Falls, Ont.—A by-law will be submitted to the ratepayers on Sept 18, to grant a remission of taxes for ten years and necessary electric power at $10 per h.p., to the Perfection Tire & Motor Co., of Madison, Wis., who propose establishing a factory here. A site covering 15 acres has been secured. Richard T. Evans, of Madison, Wis., is vice-president of the company.

London, Ont.—The Middlesex Mills, Ltd., which has a capital of $250,000, has purchased a factory building here and will manufacture cotton, linen, silk and woollen goods. The building has over 25,000 square feet of floor space. The company will handle everything connected with the manufacture of the product except the spinning of the yarn. They have their own dye plant and will make their own chemicals for bleaching purposes.

Peterboro, Ont.—The contract for the erection of the Lambton Flax Co. plant has been let to the J. J. Kerr Co., of this town, for $15,000. Work will be begun at once, and some of the buildings and the retting tanks are to be completed this fall, the balance next spring. The buildings will be of the most modern type for flax mill purposes and are intended to serve as a Government model for flax factories.

Municipal

Edmonton, Alta.—The City Council propose purchasing additional fire fighting apparatus.

Merrickville, Ont.—A by-law to grant a loan of $30,000 to the Rideau Power Co., was defeated by a majority of 85 to 6.

New Glasgow, N.S. — The Town Council contemplate extending the waterworks system. E. S. Fraser is town engineer.

St. Thomas, Ont.—The City Council are considering the construction of a sewage disposal system. M. Ferguson, City engineer.

Dunnville, Ont.—A by-law will be noted on by the ratepayers on Sept. 25 to raise $53,000 for installation of a hydro-electric plont.

Bassano, Alta.—A by-law will be voted on to raise $7,000 for the purchase of the electric light and power plant of the Alberta Electric Co.

New Glasgow, N.S. — The Town Council propose extending the waterworks system at a cost of $100,000. E. S. Fraser of New Glasgow is preparing plans.

North Bay, Ont.—On Sept. 18, a by-law will be voted on to authorize a $15,000 guarantee of bonds of the North Bay Hat Mfg. Co., with other concessions.

Aurora, Ont.—The Town Council have engaged James, Loudon & Hertzberg, consulting engineers of Toronto, to prepare plans for a sewerage disposal system.

Aylmer, Que.—The lowest tender recently received for the proposed water filteration plant was submitted by the Norwood Engineering Co., of Cowansville, Que., at $33,000.

Lethbridge, Alta.—A by-law will be submitted to the ratepayers on Sept. 15 to raise $9,375.66 for extension of electric light system; $1,000 for extension of ash flue at electric power house; $6,700 for extending electrical system.

Winnipeg, Man.—A tender for the entire completion of the capital building was submitted by J. McDiarmid & Co., for $3,128,018. The lowest tender for the steel work in the dome was submitted by the Manitoba Bridge & Iron Works at $169,960 and for the plumbing, heating and ventilating Green & Litsten at $203,981.

St. Mary's, Ont.—At a special meeting of the Council on Aug. 28, a resolution was passed urging the Water and Light Board to install the gasoline pumping plant recommended by the inspector of the Underwriters' Association on his visit here last March. The sum of $4,000 has been voted for the purpose. It is proposed to drill new wells, making the new plant entirely independent.

Wood-Working

Harriston, Ont.—The casket factory here was destroyed by fire on Aug. 30. The loss is heavy.

Windsor, Ont.—The Windsor Lumber Co. are building a large addition to their mill on Cameron Ave.

New Westminster, B.C.—The Dominion Cedar & Shingle Co. are clearing the site for their new shingle mill next the Lulu Island bridge on water frontage leased from the city.

New Westminster, B.C.—The Marsh Hutton Powers Co. propose to build a shingle mill on Lulu Island, and have leased a site from the city. Approximate cost, $30,000.

New Westminster, B.C.—Fire, on Aug. 24, completely destroyed the shingle mill and boiler room of the Brunette Sawmills Co., in Sapperton, causing damage estimated at $20,000, covered by insurance. It is expected that the company will proceed at once to rebuild the shingle mill.

Railways -- Bridges

Victoria, B.C.—Agreements have been concluded whereby the construction of the proposed Johnson street bridge will be proceeded with.

St. John, N.B.—The C. P. R. are reclaiming a large area on the western side of the harbor, to be utilized as a freight yard, with accommodation for 1,800 cars. A 200,000-gallon water tank is also being erected by the railway.

Montreal, Que.—The Montreal and Southern Counties Railway intends to construct a number of new terminals along the route between this city and Granby for the accommodation of the increasing business that is now offering.

Tenders

Ottawa, Ont.—Tenders will be received up to Friday, September 8, for the following material: One portable gasoline-driven air-compressor, 100 cubic feet capacity; four pneumatic caulking hammers; two 5-ton chain blocks. Specifications may be obtained on application to A. F. Macallum, Commissioner of Works.

Ottawa, Ont.—Tenders will be received until September 29, for the construction of an extension to the west breakwater at Port Stanley, Elgin County, Ont. Plans and forms of con-

Why the Welland Canal Zone?

ASK THE ENGINEERS OF THE INTERNATIONAL NICKEL CO.

They spent two months in examining industrial sites from the Atlantic to Lake Huron. Now they are building their big plant covering 25 acres in the Welland Canal Zone. Why?

Because of abundant cheap power

Because of unrivalled rail facilities

Because of the advantages of Lake shipping

The Welland Canal Zone has the strongest combination of Industrial Facilities in Canada. Twenty-five big industries of continental reputation have proved it in the last five years.

RAILROAD RATES

Rates from Welland to the North-West and Pacific Coast, all rail, are the same as from all other manufacturing points in Eastern Canada lying between the Detroit River and Montreal. These rates are fixed by the Board of Railway Commissioners for Canada.

On account of the close proximity to the border, Welland is in the Buffalo switching group and takes the Buffalo rate from the east and south, and enjoys quick delivery on all raw material imported from the United States.

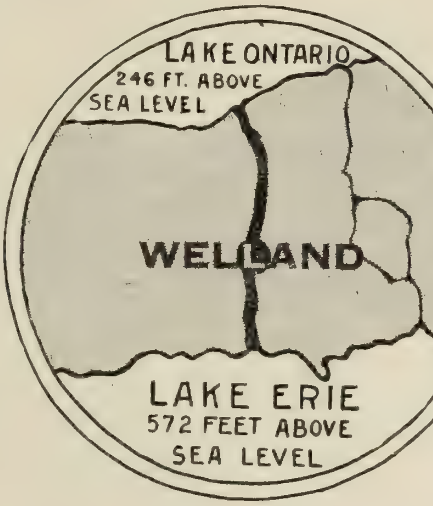
The fact that all of these roads centre here creates competition, and is the biggest lever the manufacturers have for securing efficient service from the railroads.

The seven railroads are as follows:

Grand Trunk -- Michigan Central - Toronto, Hamilton & Buffalo—Canadian Northern —Pere Marquette -- Canadian Pacific—Wabash.

Switches or spurs are constructed on the basis of cost, the manufacturing firm paying the cost price and the railroads refunding a fixed sum for every car switched over the spur until the full amount is rebated. This rule prevails throughout the entire Dominion of Canada, and no one district has any advantage in this matter.

The WELLAND WAY



THE SHIP CANAL THAT WILL CARRY MORE VESSELS & MORE TONNAGE THAN PANAMA

POWER RATES

Welland is the industrial hub of the Niagara Peninsula, where an unlimited amount of electric power is available and sold at competitive prices, owing to the numerous power companies represented there.

Every factory in Welland is driven by electric power supplied by the Ontario Power Company, of Niagara Falls, which is about twelve miles east of Welland, or from the Dominion Power Company of DeCew Falls, which is about twelve miles north of Welland. The fact that we have competitive companies operating in this district gives us competitive prices on power.

LAKE SHIPPING

Welland is situated on the Welland Canal, the great Marine highway, between tide water and the Canadian Northwest,. with daily freight service both ways.

The canal carries boats of fourteen-foot draft, but work has now begun on canal enlargement to the amount of fifty million dollars to provide for twenty five foot draft.

In these days of keen competition, water transportation has become an absolute necessity to manufacturers, and Welland holds the distinct position of being the only municipality in the entire Dominion of Canada, owning and operating its own municipal wharf, accessible by all shippers and steamboat lines alike, without charges of any kind.

Welland is a port of entry for all upper lake lines of steamers giving low rates and quick dispatch, the advantages of which are enormous.

Send for Booklet that tells the story of Welland from the Manufacturer's standpoint.

Louis Blake Duff,
Industrial Commissioner, WELLAND, CANADA

tract can be seen, and specification and forms of tender obtained at the Department of Public Works, Ottawa, at the offices of the District Engineers at Windsor, Ont., and Equity Building, Toronto, Ont., also on application to the Postmaster at Port Stanley, Ont.

Ottawa, Ont.—Tenders addressed to J. W. Pugsley, Secretary Department of Railways and Canals, Ottawa, Ont., will be received up to September 18, for the construction of foundations for 500,000 bushel storage capacity grain elevator, working house and track shed at St. John, N.B. Plans, specifications and blank form of contract may be seen at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa; at the office of the Chief Engineer, Moncton, N.B.; at the office of the Terminal Agent, St. John, N.B., and at the office of the John S. Metcalfe Co., Ltd., Engineers, Montreal, P.Q.

Ottawa, Ont.—Tenders will be received up to October 2, for the undermentioned metal supplies for delivery to H.M.C. Dockyards at Halifax, N.S., and Esquimalt, B.C.: Items 1, steel angles, bars, sheets and plates; 2, iron bars, fire bar; 3, brass bars and sheets; 4, copper sheets and bars; 5, solder, tin, and alloys; 6, tubes, brass and copper. Forms of tender and full information may be obtained by application to the Department at Ottawa, or to the Naval Store Officers, at H.M.C. Dockyard, Halifax, N.S., and Esquimalt, B.C. In making application for forms, the particular item or items for which forms are required should be clearly stated.

Chesley, Ont.—Tenders will be received until September 11, for the following material taken from the Chesley Electric Light Co.'s plant, which was bought by the town and rebuilt by the Hydro Commission: 1,661 lbs. .03 heavy plain copper wire, unburned; 4,192 lbs. scrap copper wire, large sizes; 1 120-kw. 125-cycle, 2,300-volt, single-phase C. G. E. alternator; 1 3-kw., 125-cycle exciter; 1 marble switchboard for generator; 1 100-light arc generator; 1 30-light Reliance arc generator; 1 25-light Reliance arc generator; 14 133-cycle transformers; about 40 arc lamps. For further information apply H. S. Sanderson, Clerk.

Contracts Awarded

Port Arthur, Ont.—The C. N. R. have awarded a contract for the proposed machine shop to J. H. Simmons, of Winnipeg.

Vancouver, B.C.—Contracts for the new Pantages Theatre have been awarded to Skene & Christie for the masonry and terra cotta work, at $95,980, and to Coghlan & Sons for the steel work, at $35,000. The heating and ventilating contracts have not been let. The entire cost of the building will be about $300,000. B. M. Priteca, of this city, is the architect.

Marine

Ottawa, Ont.—The Marine Department will notify shipping to suspend traffic above Quebec on September 11, the day on which the middle span of the Quebec bridge is to be floated into place.

St. John N.B.—The Norton Griffith Co. are proceeding with harbor development work at East St. John. Three dredges are at work, in addition to crews employed in finishing a breakwater and in excavating for a dry dock.

Port Arthur, Ont.—The Western Drydock & Shipbuilding Co., have signed contracts for two more freighters the same size and type as the two at present under construction. The company has also in sight four other freighters of the same design.

St. John, N.B.—The Maritime Dredging Co. are proceeding with the reclamation work in connection with new piers on the western side of the harbor. The total fill will be about 475,000 cub. yds., of which 150,000 cub. yds. have already been dumped.

Breakwater Completed.—A notice issued by the Marine Department, Ottawa, on Aug. 30, is to the effect that the breakwater at Goderich, Ont., has been completed to its full length of 1,400 feet, and the check water removed so that vessels can use the harbor on a direct course between the two entrance piers.

Kingston, Ont.—The steamers Rideau King and Rideau Queen, which have for years plied between Kingston and Ottawa on the Rideau River, have been taken to Belleville, where an effort will be made to sell them. Since the death of Capt. Daniel Noonan more than a year ago they have not been operated.

Icebreaker Burned.—The car ferry icebreaker St. Ignace, owned by the Canadian Towing & Wrecking Co., of Port Arthur, was destroyed by fire on August 30, in drydock at Port Arthur, Ont., where she had been recently taken for repairs. The St. Ignace was a 600-ton vessel, built in 1888. The loss represents about $50,000.

C.G.S. "Burleigh".—The schooner Burleigh will not be sold. She is a trim little vessel and in view of the shortage of tonnage on the Atlantic, it has been urged by maritime interests in Halifax that the Naval Service Department should sell her. The Department agreed, and a number of bids were received. None of them corresponded with the value of the ship, however, and the tenders have been notified that there will be no sale.

Quebec, Que.—Messrs. J. S. Thom, M. J. Hackett and W. J. Hackett, hitherto joint owners of the Quebec Transportation & Forwarding Co., have sold their interests over the entire fleet of tugs and barges of the company to the Canada Shipping Co., of Montreal. The fleet consists of the sea-going tug Margaret, the A. H. Hackett, the J. H. Hackett, and Florence, as well as the barges Zapotic, Gladys, Hackett, Katie Hackett, Frank D. Ewen, and A. D. It is understood that the selling price was $150,000.

Windsor, Ont.—United States engineers will not remove the wreck of the steamer Topeka, sunk abreast of the Mullen's coal dock, Sandwich, a week ago. The wreck lies in 30 feet of water on the Canadian side, and must be removed by the Canadian Government. Vessels navigating the river may pass on either side of the hull, but the wreck is a menace to navigation. The owners have not decided what they will do with the steamer, but should they abandon her, her cargo of coal would well repay wreckers for removing the obstruction.

Vancouver, B.C.—The C. P. R. announced recently that it had let a contract to W. D. Grant, of Vancouver, for the carrying out of a comprehensive dredging scheme on the waterfront between sheds 3 and 7. The contract will include the berth in front of the depot shed and the berths immediately east of that part now used by the Pacific Coast Steamship Co.'s steamers and others. The intention is to have a depth of water of not less than 33 feet, and it is very probable that when this work has been finished even bigger steamers than those at present running here will be employed in the service. Orders have been given to have the dredging work carried out with every expedition, and it is expected that a start will be made next week. The contract will entail an outlay of some $200,000.

British Masters and Mates.—A new policy with regard to the admission of mates on British ships has been adopted by the British Board of Trade, according to a notification which has reached the Marine Department, Ottawa. Where formerly any candidate was admitted to the examination for masters and mates certificates and was qualified to take charge of ships of British register if successful, a new rule has been made. From now till the war is over every applicant for a certificate must be a

3 BIG REASONS WHY YOU NEED

PURO

(MADE IN CANADA)

1. Puro Sanitary Drinking Fountains will give you a *better* water supply *cheaper*.
2. Puro will cut your water bills 15% to 35%.
3. PURO will safeguard the health of your employes and raise the standard of efficiency.

Are not these reasons enough? Then why hesitate longer?
PURO equipment is not expensive—the first cost is *low* and the up-keep *nothing*.
Easily attached; positively fool-proof.
Let us make you a special proposition for a try-out in one of your departments.
Write us now—to-day—giving us the number of men; an inquiry will cost you nothing.

Stampings and Metal Specialties

We have the plant and equipment for turning out stampings of the highest quality in brass, copper, aluminum, tin and steel, and are prepared to undertake the manufacture of metal specialties of any description.

PUNCHES, DIES, TOOLS.

COLEMAN FARE BOX COMPANY, LTD.
70 Bond St., Toronto

British subject, and at the time of his birth each parent must have also been a British subject. It is understood, however, that the Canadian authorities will not adopt the same regulations, but will follow the same practice as formerly, admitting only British subjects to the examinations.

Trade Gossip

The Wilt Twist Drill Co., of Walkerville, Ont., are moving into their new factory shortly. The buildings are of concrete and steel construction and are equipped with the most modern machinery, enabling the company to largely increase their output.

Toronto, Ont.—The two-days' sessions of the Ontario Municipal Association, holding its Eighteenth Annual Convention in Toronto, was opened by the presidet, A. K. Bunnell, City Treasurer of Brantford, on Aug. 30, in the Council Chamber of the City Hall.

Large Order for Shirts.—An order for 500,000 shirts, received from the Italian Government, has been awarded by the Department of Trade and Commerce to the Knit Goods Association, of Hamilton. This is one of a number of orders for shirts and blankets received from the French and Italian Governments.

Ottawa, Ont.—The Government has refused to accept any of the tenders for the construction of the station buildings in connection with the new Intercolonial terminals at Halifax. The prices quoted were too high, apparetly owing to the high cost of materials and labor.

The Canadian Hoskins Co., of Walkerville, Ont., are moving in October to the premises at present occupied by the Wilt Twist Drill Co. The most complete and up-to-date equipment will be installed and will give this growing concern more adequate room for the manufacture of their product, which consists of furnaces and electric pyrometers.

Britain Gets Whale Oil.—When the Arctic whalers transferred their trade to the Antarctic, Great Britain obtained control of the whole of that trade by giving out licenses. This carried with it command over an important supply of glycerine, an essential ingredient in the manufacture of the explosive cordite. In return for supplies of coal and other necessaries of their business, the licenses were endorsed with the condition that the product of the catch be sold in the United Kingdom. Result: England has received this year 600,000 barrels of whale oil, one-tenth of which was glycerine.

Record Ore Shipments. — Anoth record in iron ore shipments on t Great Lakes was made in August a cording to figures just made publi There were loaded last month 9,850,1 tons, which was nearly two million to greater than in August a year ago. F the season to Sept. 1, shipments aggr gated 39,215,864 tons, an increase more than 12,000,000 tons over the sa period in 1915, and 7,000,000 tons mo than the total movement in 1914. Vesse men are confident the total shipmen for 1916 will reach 60,000,000 tons.

Customs Receipts.—A further phe omenal rise in customs receipts indica ing the maintenance of this year's r markable trade increase is shown in th monthly statement issued on August 3 by Hon. J. D. Reid, Minister of Custom The August revenue from custom reached a total of $11,941,000 as com pared with $8,330,000, an increase o $3,610,000. For the five months of th fiscal year, the increase in custom revenue has been $21,723,000, the re ceipts having risen from $36,731,000 i 1915 to $58,454,000 during the presen year.

Exhibit of Enemy Products.—Si George Foster, Minister of Trade an Commerce announced recently that very complete collection of German an Austrian products sold largely befor the war has been made by the Britis Government and following the Britis tour the assortment will be brought t Canada. It will be displayed in Toront and Montreal and probably at othe centres. Canadian manufacturers, merchants and consumers alike will find an inspection profitable. Materials, prices, cost estimates, etc., will be made clear.

Personal

Hon. F. T. Frost, president of Frost & Wood Co., Smith's Falls, died recently.

R. A. Pyne, superintendent of the C. P. R. shops for the past five years at Winnipeg, has been appointed to the position of superintendent of motive power on the same railway at Montreal.

T. R. Rieder, vice-president and general manager of the Canadian Consolidated Rubber Co., has been elected to the Board of Directors of Ames-Holden-McCready, Ltd. His election fills the vacancy left by the recent resignation of. A. L. Johnson, who was vice-president and general sales manager of the company. **I. L. Dildine** has been appointed to the position of general sales manager.

Hawkridge Brothers Company
303 Congress St., BOSTON, MASS.
U.S.A.

E. B. Plewes of E. B. Plewes & Co., manufacturers' agents of Winnipeg, Man., is visiting Eastern Canada and the United States in Connection with his business. Mr. Plewes represents William Hall, Ltd., Alma Works, Sheffield, England, file manufacturers.

Hugh Wilkinson, former mechanical superintendent of the Brockville branch of the Canadian Northern Railway, and for many years previously an employee of the Grand Trunk, died at Brockville, Ont., on August 27. He had long since retired, having reached the age of 28.

H. R. MacMillan, Chief Forester of the Province of British Columbia, who recently returned from a sixteen months' trip to Europe, South Africa, the Antipodes, and India, in the capacity of Special Trade Commissioner for the Dominion Department of Trade and Commerce, with a view of investigating opportunities for the Canadian lumber export trade, has sailed from Victoria, en route to China, Japan, and Russia, to pursue his investigations. He will be absent for about five months. Mr. MacMillan's trip to Great Britain resulted in a number of important war orders for lumber and lumber products being directed to the British Columbia mills, and only the inability to secure adequate ocean transportation facilities prevented this business from assuming very large proportions.

New Incorporations

The Beacon Match Co. has been incorporated at Toronto to manufacture matches, with head office at Toronto, with a capital of $75,000. Incorporators: R. M. Melville, F. C. W. Wagner and K. Campbell, all of Toronto.

Martin Aeroplanes, Ltd., has been incorporated at Toronto, with a capital of $100,000, to manufacture aeroplanes of all kinds at Windsor, Ont. Incorporators: C. S. King, W. L. McGregor and W. R. Bonds, all of Windsor, Ont.

Montreal Machinery & Supplies, Ltd., has been incorporated at Ottawa with a capital of $50,000, to manufacture and deal in Machinery of all kinds at Montreal. Incorporators are: F. G. Bush, W. R. L. Sharrk and M. J. O'Brien, all of Montreal.

The Oxford Knitting Co. has been incorporated at Ottawa with a capital of $50,000 to construct and operate cotton and woolen factories. Head office at Woodstock, Ont. Incorporators: William Taylor, Ralph E. Allen and B. S. Crombie, all of Montreal, Que.

The Toronto Furniture Co., has been incorporated at Toronto with a capital of $500,000 to manufacture furniture of

The Cushman Motor Works of Canada, Ltd., have been incorporated at Ottawa with a capital of $100,000, to take over the concern of the same name located at Winnipeg, Man., and to carry on business as engineers and machinists, etc. Incorporators: A. E. Donovan, F. K. Hamilton and H. E. Kennedy, all of Winnipeg.

Catalogues

The Gray Mfg. & Machine Co., Toronto, are distributing to the trade a new bulletin No. 14, dealing with the "Gray" power pumps and water supply systems. The bulletin contains a brief description of the systems and specifications covering the various sizes of pumps and tanks, etc., with price list. The bulletin is illustrated.

Lathes.—Lodge & Shipley Machine Tool Co., Cincinnati, Ohio, have issued a complete loose leaf catalogue in which the illustrations and descriptive matter explain the operation of the company's lathes and the various uses to which they may be put. The leaves are arranged so that the several parts of the lathes are illustrated and described first, followed by pages dealing with the completed tool. The lathes listed include engine lathes with cone pulley and selective head arrangements for securing different spindle speeds, a portable lathe and one for heavy forgings. A bulletin giving examples of work done on the various machines is included.

Pumping Machinery.—Catalogue No. 29 deals with an interesting line of pumping machinery and air compressors made by the National Steam Pump Co., Upper Sandusky, Ohio. Simplex and duplex pumps for a large variety of purposes, also vacuum pumps, are dealt with, while automatic feed pumps and receivers and air compressors are also included. A general description is given of each type, with special reference to the principal features embodied in their construction. Each type of equipment is illustrated, and tables are included giving the principal dimensions and capacity of each size. The catalogue concludes with a list of parts for several types of pumps, accompanied by diagrams.

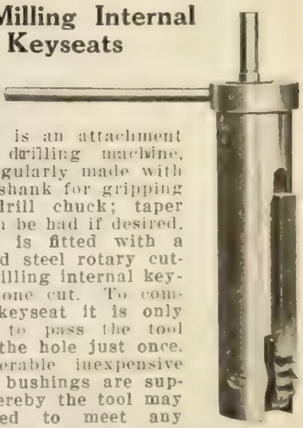
KEYSEATER
for Milling Internal Keyseats



This tool is an attachment for the drilling machine, and is regularly made with straight shank for gripping in the drill chuck; taper shank can be had if desired. The tool is fitted with a high-speed steel rotary cutter for milling internal keyseats in one cut. To complete a keyseat it is only required to pass the tool through the hole just once. Innumerable inexpensive eccentric bushings are supplied whereby the tool may be bushed to meet any diameter above its own.

FAIRBANKS-MORSE
New and Used Machinery

In Stock at Toronto

1—5' Bickford Universal Radial Drill; used.
1—¾" 4-spindle National Acme Automatic; used.
2—No. 3 Foster Hand Screw Machines; new.
4—No. 4 Smurr & Kamen Turret Lathes; new.
2—14" x 5' Seneca Falls Lathes; used.
1—1[illegible]" x 5' Seneca Falls Lathe; used.
2—18" x 8' Springfield Lathes; new.
5—2[illegible]" x 7' and 9' Fairbanks-Morse Lathes; new.
1—Gisholt Universal Tool Grinder.
2—No. 1 Racine Hacksaws; new.
1—No. 3¼ A Oster Pipe Machine; new.
1—2[illegible]" x 8' Hendey Lathe; used.
1—Gisholt 16" Special Lathe, type C, 6½ bore.
2—Walcott 8" and 20" x 8' Lathes.

In Stock at Montreal

2—16" F. M. Single Purpose Lathes; used.
1—Hendey 16" x 8' Lathe, taper attachment, Q.C.G.; used.
2—American 16" x 6' Tool-room Lathes; new.
2—Barnes 18" x 8' Lathes; new.
1—Walcott 20" Lathe, 3-step cone, D.B.G. and Q.C.G.; new.
3—Walcott 18" Lathes, 3-step cone, D.B.G. and Q.C.G.; new.
1—Rivett Precision Lathe; used.
1—Seneca Falls 9" x 4' Star Q.C.G. Tool-room Lathe.
1—Brown & Sharpe No. 1½ Universal Miller; used.
1—Ford-Smith Plain Miller; new.
W. & M. Drill Grinder; new.
1—Hall No. 6 Cutting-off Machine, 6" Shells; new.

This is only a partial list of our stock of Machine Tools.

CANADA'S DEPARTMENTAL HOUSE FOR MECHANICAL GOODS

Milling Machines

Slab Millers

Beaman & Smith, 92" between housings, 72" under adjustable swivel rail, 2 heads on rail, platen 48" x 15', also has side boring head.

Ingersoll, 3 heads, adjustable rail, 42" between housings, working surface platen 36" x 12', approximate weight 55,000 lbs.

Newton Duplex Horizontal Milling Machine, extreme distance between heads 42", platen 20" x 10'.

Detrick & Harvey Milling, Drilling and Boring Machine, power feed to head in all directions, power feed to boring bar, two tables on side of base, tables raised and lowered by power; weight 16,000 lbs.

Newton Heavy Duty Vertical, rotary table, 48" diameter, 38" from centre of table to column, nose of spindle 5½" diameter, for motor drive, approximate weight 20,000 lbs.

Horizontal Millers.

No. 1½ Cincinnati Universal.

No. 1-B Milwaukee Plain, with dividing heads, vise and chuck.

No. 1 Cincinnati Plain

No. 9 Kempsmith Plain.

No. 4 Garvin Profiler.

No. 1 Garvin 2 spindle profiler.

No. 3 Brown & Sharpe Plain

No. 22 Garvin Plain, table 9" x 44'.

Presses—Shears.

Toledo Double-Crank Geared Forging Press, approximate weight 20,000 lbs.
DG-56 Ferracute, Straight Column Redrawing Press, 13,700 lbs.
Farrell Double Crank, Back Geared Straight Sided Press, 9,000 lbs.
No. 4 Bliss Straight Sided Double Crank Geared Press.
No. 2 Bliss Straight Sided Double Crank Press.
PG-6 Ferracute Punching Press, 12,000 lbs.
Bliss Straight Sided Press, 7" stroke, weight 3,000 lbs.
No. 3 Manville Straight Sided Press, 1" stroke.
Bliss Straight Sided Press, 8" stroke, 4,000 lbs.
No. 4 Farrell Punching Press, 1½" stroke.
No. 24 Zeh & Hahnemann Horning Press.
350-ton Hoe Hydraulic Press.
Cleveland Combination Punch and Shear, 26" throat, also has angle knives.
Size "D" Long & Alstatter Bar Iron Shear, 3½" capacity.
No. 2 Long & Alstatter Double End Punch and Shear, punches 1" hole through 1" metal, shears 6 x 1" flat bars, or 1¾" round bars.

Cleveland Single End Punch, 22" throat, will punch 1" in 1" metal.

Bass Double End Punch and Shears, 20" throats, will punch 1¼" in ¾" metal, will shear ⅝" plate.

Bement Splitting Shear, 26" throat, ⅝" plate capacity.
Sellers Double Angle Shear, 8" x 8" x 1" capacity.
Cockburn Direct Acting Punch, capacity 1" in 1" metal.
Bement Single End Punch, 30" gap, capacity, 2" in 1" metal.
Kling Punch, 24" throat, capacity 1¼" in 1" metal.
Wilson Double End Punch and Shear, 6" throats, capacity ¼" hole in ½" metal.
8 ft. Lennox Rotary Splitting Shear, capacity ⅝" plates.

Large Lathes.

76" x 22' Pond, blocked to 114", quadrupled geared, face plate drive, screw cutting.
50" x 24' Johnson, face plate drive, screw cutting
48" x 25' Putnam, screw cutting
42" x 24' New Haven, screw cutting.
38" x 24' Putnam, screw cutting.
36" x 15' New Haven, screw cutting.
34" x 16' Perkins, screw cutting.
32" x 14' Bogert, screw cutting
30" x 28' Pond, screw cutting.
28" x 18' Gray, screw cutting.
24" x 24' Pond, screw cutting.
24" x 20' Pond, screw cutting.

NEW AND RE-BUILT MACHINERY

Why buy these tools from Commission Houses? We own every tool that we advertise and guarantee each and every one to be as represented. You can secure immediate shipments by buying direct from us and save the middleman's profits.

NORTON GRINDERS

18—6 x 32 Plain Grinders.

12—10 x 22 Plain Grinders.

These machines have been rebuilt and are in excellent condition.

1—8 x 30 Walker Surface Grinder.

2—10 x 36 Plain Grinders, used only three months. In exceptionally good condition.

BEMENT-MILES BORING MILLS

6—60" Boring Mills, 2 swivel heads. In excellent condition.

SELLER'S BORING MILLS

6—60" Seller's Boring Mills, 2 swivel heads—only slightly used—in first-class condition.

6—84" Seller's Boring Mills, 2 swivel heads, excellent condition

AMERICAN LATHES

6—20 x 8 actual swing, 22 American High Duty Lathes with Quick-Change Gears, Double Back-Geared, Four-Sided Turret Post, $1050.00 each, F.O.B. Albany, N.Y.

48 x 12 G. & Eberhart Gear Cutter (bevel and spur gears).

Simmons Machine Company, Inc.

981 Broadway, Albany, New York

New York Office: 902 Singer Building, New York City

FOR SALE

We are offering subject to prior sale,

Immediate Shipment

One slightly used

"TYCOS" RECORDING THERMOMETER

registering to 500 degrees F., manufactured by Taylor Instrument Co., Rochester, N.Y., with supply of indicator sheets, H. and M. divisions.

GUARANTEED IN FIRST CLASS CONDITION.

GRINDING MACHINES

1 Wilmarth & Morman Universal Tool and Cutter Grinder (new).
2 Wells No. 190 Universal Tool and Cutter Grinder (new).
1 Wilmarth & Morman Style B-X Universal Cutter and Drill Grinder (new).
1 10" x 36" Landis Plain Grinder (new).
1 10" x 20" Landis Plain Grinder.
2 12" x 24" Modern Plain Grinders (nearly new).
1 14" x 50" Norton Plain Grinder (nearly new).
2 18" - 30" x 96" Norton Gap Grinders (nearly new).
2 Landis Internal Grinders with No. 75 Heald Heads (nearly new).
1 No. 70 Heald Internal Grinder.
2 No. 60 Heald Cylinder Grinders (nearly new).
1 16" x 66" Landis Crank Shaft Grinder (18 months old).
2 14" Swing Special Internal Grinders, capacity ½" to 14" dia. straight or taper.
1 New Yankee, style L, Drill Grinder (new).
1 No. 6M Besley Double Disc Grinder.
1 No. 300 Safety Emery Wheel Ring Wheel Grinder.

TURRET LATHES

58 Potter & Johnson No. 6-A Automatic (new).
8 Potter & Johnson No. 5-A Automatic (nearly new).
12 13" Gisholt Semi-Automatic (12 mos. old).
20 21" Gisholt Semi-Automatic (12 mos. old).
5 J & L two spindle (new).
1 J & L 2 x 24 with bar equipment, motor driven (fine condition).

MILLING MACHINES

1 No. 3 Garvin Universal (new).
1 No. 8 Becker Duplex (new).
1 No. 2 Rockford Hand Miller.
3 No. 0 Bristol Hand Millers.
1 Newton Duplex with 72" table feed.
1 No. 3½ Becker Vertical with Dividing Head.
1 Small Duplex Miller.
1 No. 4 Hendey type Lincoln Miller (nearly new).

DRILLING MACHINES

1 8-spindle Bausch Multiple, 1" capacity.
1 12" Spindle Garden ½" capacity.
6 Barnes 24" 2-spindle All Gear Drive (new).
1 24" Hoefer Sliding Head (new).
4 Henry & Wright No. 1 style K (nearly new).
12 Colburn Heavy Duty, size D-2 (new).
27 Colburn Heavy Duty, size D-4 (new).
1 26" Rockford Sliding Head (fine condition).
3 4-spindle Dwight slate, 14" swing, ¾" capacity.
2 Peerless 20" (new).
1 20" Mechanics (new).
1 20" Buffalo (new).
1 28" Hamilton Sliding Head.
11 Burke No. 1 Bench (new).
1 25" Kern Sliding Head with Tapping attachment.
362 Paragon High Speed Drills, 1¾" x 14" flute, 21" over all (new).

RADIAL DRILLS

1 36" Dreses, with quick return tapping attachment (fine condition).

ENGINE LATHES

38 16" x 8' Fairbanks-Morse (new).
1 18" - 36" x 8' Fay & Scott Extension Gap (fine condition).
1 30" x 12' LeBlond.
1 12" x 6' American.
1 28" x 14' Fifield.
1 14" x 4' Blaisdell.
1 No. 4½ Barnes.
1 54" x 21' Detrick & Harvey.
1 26" x 10' Bradford.

MARKING MACHINES

2 Noble & Westbrook No. 1 (new).

PROFILERS

1 No. 3H Becker (new).

PLANERS

1 30" x 30" x 10' Ohio with two heads (new).
1 44" x 44" x 12' L W Pond with three heads.
1 40" x 40" x 12' New Haven, with one or two heads.
1 36" x 36" x 12' Sellers widened to 72".

AUTOMATIC GEAR CUTTERS

1 No. 3 Brown & Sharpe 26" (old machine).
1 36" x 4" Fellows Gear Shaper (fine condition).
1 18" Schuchart & Schutte Tooth Rounder (nearly new).

CUTTING OFF MACHINES

1 4" Hurlbut-Rogers Cone Drive (fine condition).
18 Newton No. 500 Gold Saw Machines with 20" inserted tooth blades (new).

BELT LACING MACHINES

1 12" Jackson (new).

KEY SEATERS

1 No. 1 Catlin (new).

SCREW MACHINES

1 No. 3 Stecher (new).
1 1" x 8" Pierce (new).
3 No. 2 Southworth (nearly new).
4 No. 2 Warner & Swasey, with power feed turret (nearly new).
4 No. 54 1⅜" capacity National-Acme (used two years).
1 No. 4 B. & O. power feed turret, friction back gears.
1 No. 4½ B. & O., power feed turret, friction back gears.
1 2" x 24" Jones & Lamson Motor Driven (fine condition).
1 No. 6 Warner & Swasey 2¼" capacity back geared but no power feed to turret (nearly new).

BROACHING MACHINES

1 No. 3 La Pointe (nearly new).

BOLT CUTTERS

1 2" Landis Double Head (nearly new).

BORING AND TURNING MACHINES

1 4' Bickford Boring & Turning Mill (nearly new).
1 20" swing 4-Spindle Moline Vertical Boring Machine with 18" x 36" table.

BULLDOZERS

1 No. 4 Williams White (old).
1 No. 1 Williams White.

FILING AND SAWING MACHINES

1 Large Filing and Sawing Machine with 12" stroke.

PUNCHES AND SHEARS

1 No. 3 Walsh Punch Press.
1 Moser 1½" stroke Punch Press with Automatic Feed.
1 No. 17 Williams White Double End 8" throat capacity ¼" x ¼".
1 27½" throat lever punch ½" capacity 1¼" stroke.
1 Thompson Bevel Shear ½" capacity.

PIPE MACHINES

1 6" Saunders.

SHAPERS

1 14" Hendey Geared Friction.
1 20" Hendey Geared Friction.

TAPPING MACHINES

1 Garvin No. 1 Automatic (new).
4 Geometric High Speed Tapping Devices, style N (new).
4 Murchey 2" collapsible taps (new).

THREAD ROLLING MACHINES

1 Waterbury Farrell ⅜" capacity (nearly new).

THREADING MACHINES

5 Special Threading Machines for threading 3" steel shells (nearly new).

SPOT WELDERS

1 No. 3 Toledo Type 14-A 220 volts 60 cycles (nearly new).

BAIRD'S MACHINE TOOL LIST

Every Machine Listed Can Be Seen in Our Warehouse

LATHES.

2—20" x 8' Walcott Quick Change Gear Lathes.
1—20" x 12' Bradford Lathe plain change gears complete with chuck.
1—14" x 10' Lodge & Shipley Lathe, quick change, turret on carriage.
1—10" x 4½' Imperial Lathe with compound rest and C.S.
1—16" x 12' Lathe rise and fall rest with chuck.
1—20" x 12' New Haven Lathe and countershaft, face plates, chucks follow and steady rests, plain change gears.
1—32" x 12' Shepard Lathe Quick Change, light pattern.
1—10" x 4½' Shepard Quick Change foot power lathe.
3—18" x 8' Walcott Quick Change Double Back Geared Lathes (new).
1—18" x 8' South Bend Plain Lathe.
1—17" x 7' Street Semi-quick change Lathe.
1—16"—36" x 9½' Fay Scott Gap Lathe complete with chuck.
1—18" x 10' Draper Plain Heavy Duty Engine Lathe.
1—36" Double side Pulley Lathe.
1—14" x 6' Prentice Plain Engine Lathe.
1—14" x 6' Carroll-Jamieson Plain Engine Lathe.
1—15" x 6' Rockford Plain Engine Lathe.
1—15" x 6' South Bend Engine Lathe.
1—16" x 10' Perkins Plain Engine Lathe.

SCREW MACHINES.

2—No. 3 Screw Machines complete with wire feed, automatic chuck hand feed to turret.
2—No. 4 Screw Machines geared friction head complete with wire feed, automatic chuck hand feed to turret.
1—No. 4 Geared friction head screw machine complete with wire feed, automatic chuck power feed to turret.
1—2¼ Capacity Modern Flat Turret Lathe with bar and chucking equipment.
1—3¼ Gridley Automatic.

SPEED AND TURRET LATHES.

2—22" New Turret Lathes, heavy duty type.
1—No. 6 Bliss Spinning Lathe (almost new).
1—Lodge Baker Speed Lathe.
1—Small Lathe rise and fall rest and C.S.
2—Small Speed Lathes.
1—1" Capacity Garvin Turret Lathe.

SHAPERS.

1—32" Walcott Shaper
1—18" Barker Shaper single back gear.
1—24" Cincinnati Back geared Crank Shaper.

MILLERS AND GEAR CUTTERS.

1—Farwell Quick Change Hand Miller.
1—No. 1 Farwell Automatic Gear Hobbing Machine.
1—Keyseating Miller with long table.
2—U.S. Hand Millers.
2—Warner & Swasey Single Spindle Profilers.
1—No. 2 Cincinnati Vertical Milling Machine (almost new).
1—Farwell Gear Testing Machine.

DRILL PRESSES.

1—36" Mueller Radial Drill with tapping attachment, cone drive swinging table.
1—36" American Sensitive Radial Drill.
2—1 Spindle High Speed Ball Bearing Reed Drills.
1—Double Head Taylor & Fenn Sensitive Drill with tapping attachment.
1—22" Hoefer Drill Power Feed Back Geared.
3—4 Spindle Drill Presses.
1—13" Reed Sensitive Drill.
1—48" Drill Press, screw feed with hand wheel.
1—4 Spindle Drill Press, capacity ¼ drill.
1—32" 4 Spindle National Turret Drill Press No. 4 Taper in spindles.
1—Foot Burte 3 spindle Sensitive Drill.
1—1 spindle Allen Sensitive Drill High speed ball bearing.

ELECTRIC DRILLS.

1—¾ Electric Drill 110 volts D.C.
1—Standard Type Electric Drill 110 D.C. ¾ capacity.
1—Hisey Wolf Friction Motor Bench Drill 110 volt D.C.
1—Thor Universal Electric Drill, capacity ¼" 110 volts.
1—Style G.I.U.S. Electric Drill 1¼ capacity.

SCREW AND PUNCH PRESSES.

1—No. 2 Rockford Inclinable Press.
1—No. 1 Springfield Straightening Press.
1—No. 1 Verdin & Knappes Inclinable Press.
1—No. 2 Barnes Screw Arbor Press.
1—No. 5 Eames Mandrel Press.
1—Small double crank press, adjustable crank size of table 14" x 20".
1—No. 30 Bliss Straight Sided Press.
1—No. 3 Eames Arbor Press.
1—No. 3 Advance Inclinable Press.
1—Foot Press.

PLANERS.

1—17" x 17" x 20" Crank Planer, one head.

SAWS.

1—Millers Falls Hack Saw 12" Blade.
1—12" Millers Falls Power Hack Saw.
1—12" Hack Saw.
1—12" Millers Falls Hack Saw.
5—No 1 Marvel Hack Saws.
1—West Haven Power Hack Saw.
1—No. 11 Higley Circular Saw.

KEYSEATERS.

1—No. 2 Mitts & Merrill Keyseater.
1—No. 0 Giant Mitts & Merrill Keyseater.
1—No. 1 Catlin Keyseater.
1—No. 0 Catlin Keyseater.

HAMMERS, PUNCHES, SHEARS AND ROLLS.

1—200 lb. Beaudry Champion Hammer.
1—800 lb. Williams & White Board Drop Hammer.
1—No. 1 Large Dayton Power Hammer.
1—60" Double Geared Heavy Bending Roll.
1—40" Danielson Power Squaring Shear complete with two large wood pulleys.

TINNERS TOOLS.

1—39" Double Truss Cornice Brake.
1—No. 230 P. S. & W. Folding Machine 30".
1—17" Set Hand Slip Rolls.
1—30" Square Shear complete.
1—Hand Lever Bench Shear.

HOISTS.

2—1 Ton Tribloc Chain Fall.
1—1½ Ton Tribloc Chain Fall
1—Standard 4 Wheel trolley for chain fall.
1—No. 2 Hercules Portable Crane.
1—Portable crane—no chain.
1—Universal Swiveling Portable Crane.

FURNACES.

1—Gas Furnace 19" x 18" x 11" Fine order.
1—No 8 Hinz Furnace.
2—Stewart Tool Hardening Gas Furnaces.

WOOD WORKING MACHINERY.

1—Gun Stock Lathe.
1—Porter, 2 spindle router and cutters.
1—Saw Gummer 40" Capacity for bench, S.C. Rogers Co. make
1—Iron Frame table with tight and loose pulleys, gauge and fence.
1—42" Connell and Dengler Band Saw.
1—30" Frank Band Saw Light Pattern plain guides.
1—Rollstone Machine Works Adjustable Saw Table, size 3' x 3' with Jack Shaft.
1—Frank 24" Wood Surfacer.
1—26" Band Saw and two saws.
1—Mitre Saw.
1—Power Mortiser.
1—Small Boring and Sanding Machine.
1—20" Silver Band Saw.
1—Crescent Band Saw.

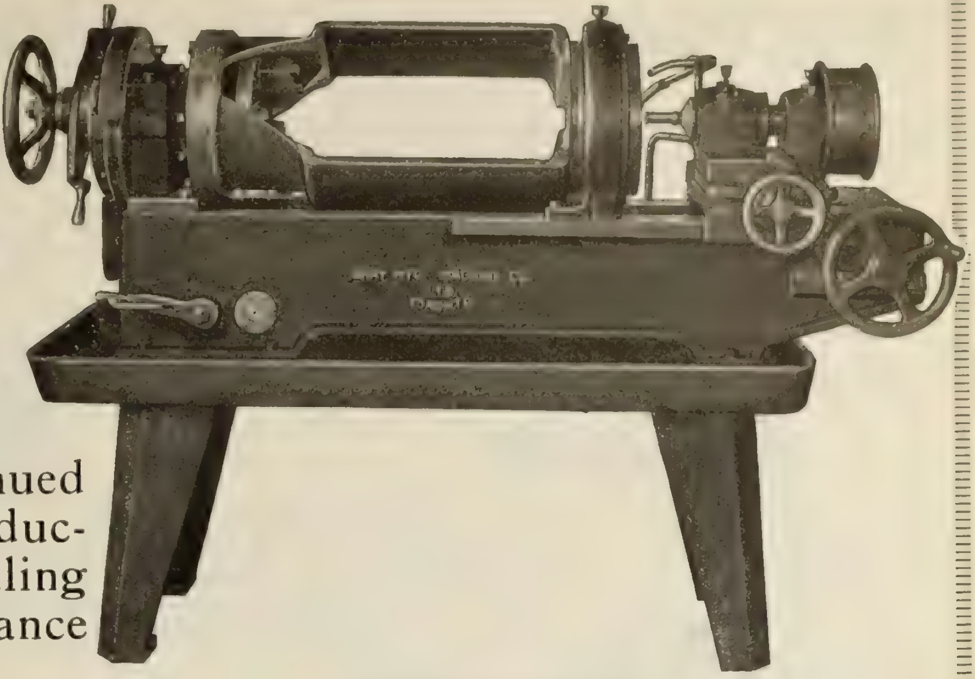
Thread Millers



MACHINE FOR 9.2 SHELLS

The design and build of these machines are assurance of continued accuracy, high production, ease of handling and low maintenance cost.

Two speeds for Threading and Facing all sizes from 4.5 to 9.2 Shells, Sockets and Plugs.

Prompt Delivery

Gray's Sand Blasts and Dust Arresters

THE GRAY MFG & MACHINE CO.
TORONTO

Are performing a service in the manufacture of shells that is making them a necessity for this work.

They cut off the scale after nosing in.

They smooth away the boring tool marks.

They work either with sand, shot or steel grit.

Our Dust Arresters can be used with any standard make of Sand Blast.

The Gray Mfg. & Machine Co.
LIMITED
686-692 St. Clarens Avenue, Toronto

WILLIAMS' "AGRIPPA" TOOL HOLDERS

"THE HOLDERS THAT HOLD" THE

"SUPERIOR CHARACTER" ENDORSEMENT

of the only mechanical jury that examined them at Frisco, and the "Grand Prize" of the P. P. I. E.

afford rapid adjustment, ample bearings, protected fastenings, exact temper, all-round usefulness and exceptional economy—all essential elements of "SUPERIOR CHARACTER" to the trained mechanic.

NO. 81 AGRIPPA BORING-TOOL HOLDER

The Boring Tool takes any size or shape of bar and requires no bushings. Its sleeve bar permits either straight or angular adjustment of cutter without resetting.

NO. 92 AGRIPPA PLANING TOOL HOLDER

The Planing Tool with thirty-six angles of adjustment may be used on shapers or for heavy turning on lathes.

J. H. WILLIAMS & CO.

45 Richards Street BROOKLYN, N.Y. CITY

The Wrench People

Western Office and Warehouse,
40 So. Clinton St., Chicago, Ill.

Write for their 1916 class record and buy them through your dealer.

The Threading Tool with lockable spring head will do roughing, finishing and threading at one setting in the tool post.

A tool that performs both cutting-off and side work by the mere substitution of suitable cutters tells its own story of economy.

WE MANUFACTURE

Special Machinery, Tools and Gauges for the manufacture of Munitions.

WE MAKE TO ORDER

Special Machinery for any purpose.
Gauges, Tools, Cut Gears, Molds for rubber, Etc., Etc.

Determine, Measure and Eliminate
LOST TIME and MOTION

Master Cronograph

The day of advanced prices only for the purpose of advanced profits has now passed.

To "economize" on selling expense may be "to save yourself into bankruptcy."

The one opportunity for the manufacturer to increase his profits is by a reduction of costs.

Labor in America will never sell itself cheaper than to-day, and the cost of materials is increasing yearly.

Therefore, increased profits in your plant are dependent upon just one thing:

You must determine, measure and eliminate lost time and motion.

The Master Cronograph will enable you to determine without further calculation just what a man or a machine DOES DO and SHOULD DO in an hour or a minute.

With such information, you may STANDARDIZE the operation—INSTRUCT your men to a more profitable effort and MEASURE their work in terms of the new standard—thus extracting from your present conditions an added profit without the expenditure of an extra dollar.

The Master Cronograph is the one device which will show at a single rating the total of its computation. The only stop watch that will reduce net time to output or production per hour without the use of a pencil. It embodies a 17-jewel time-piece. Write for literature.

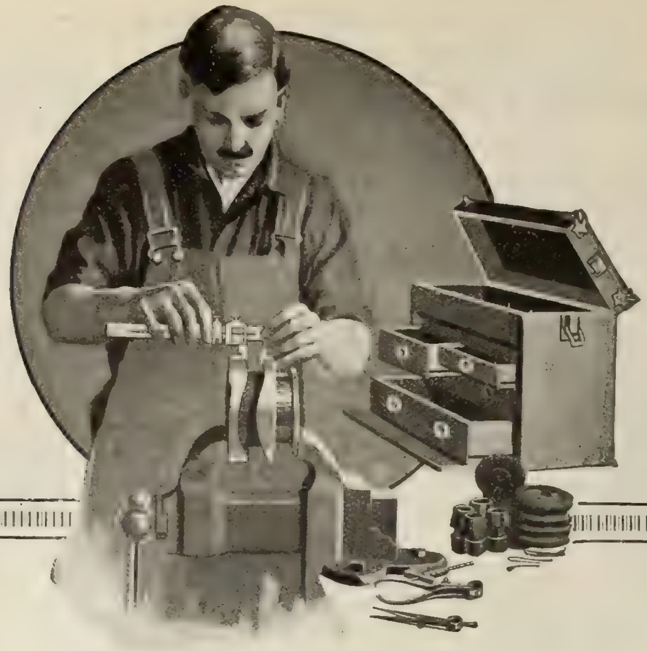
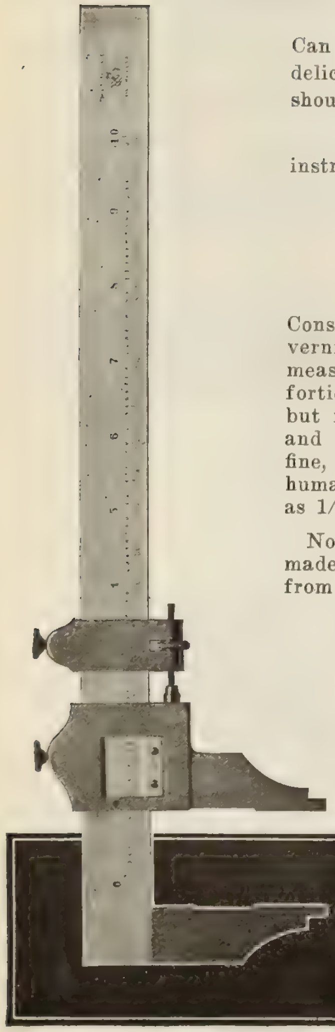
If any advertisement interests you, tear it out now and place with letters to be answered.



What Makes a Vernier Caliper Accurate?



Can one vernier caliper be better than another? Is there a difference in the quality of such delicate instruments as this? If accurate government standards are accessible to all, why should one instrument be superior to another?

The answer is just this—the quality of the graduations determines the quality of the instrument and the cleanest, sharpest graduations are found on

Starrett Vernier Calipers

Consider that the finest graduations on a vernier caliper are 1/40 of an inch. To measure thousandths of an inch, these fortieths must be split into twenty-fifths, but if the graduations on the fixed scale and the vernier plate are not sharp and fine, it is physically impossible for the human eye to discern adjustments as fine as 1/1000 of an inch.

Now, while our vernier calipers are finely made, with accurately graduated scales from carefully selected and hardened steel, and with fine workmanship, we leave our whole claim for actual supremacy to the man who examines the graduations of the tool and finds them cleaner, finer, and sharper than any he ever saw before.

Look at those graduations under a microscope and see for yourself if they are not cleaner, daintier, and snappier than you have seen before. Then decide whether you will trust really accurate work to any but Starrett Tools.

Catalog 213 contains 336 pages of fascinating reading for the man who loves tools. It's free to men interested.

HAMMOND
DIE BLOCKS
FOR
Difficult Dies and Record Runs
Speed in Machining
Safety in Hardening

SPECIAL
Trimmer Tool Steels
for hot and cold work

HAMMERED crucible cold trimmer Die Tool Steel means longer runs between grindings—less wasted time dragging down production.

Our Products
"Hammered from Ingot to Finished Bar"

HAMMOND STEEL & FORGING CO.
FINE TOOL STEELS
Specialists in Manufacture of
HIGH GRADE HAMMERED FORGINGS
WELDLESS RINGS, HAMMERED ALLOY STEELS, SPECIAL SHAPES

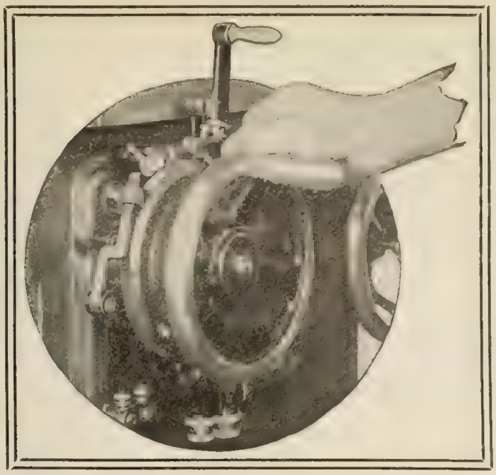
MAIN OFFICES and MILLS:
Syracuse, N. Y.



Every Pinch of the Thumb Latch Gives a Quarter Thousandth Reduction

This is a quite simple way to set the Automatic Cross Feed on a Grinding Machine so that it will automatically reduce the work to the required size. Suppose after the trial cut the piece is .0015″ large. Then simply pinch the thumb latch six times and the cross feed will automatically stop when the diameter is correct; you do not have to refer to graduations. Any part of the full amount of feed can be made at either end of the table traverse.

Brown & Sharpe Plain Grinding Machines

are constructed with many other operating conveniences in addition to the above, which improve the quality and quantity of production and make them popular with the operator. Did you ever investigate the advantages of our Universal Back Rests, for instance? They are arranged to automatically maintain a correct and uniform pressure behind and below the work until it is reduced to the required diameter, then stop. They are of particular advantage on slender or splined work. The convenience of the automatic cross feed and back rests often enables an operator to handle more than one machine. Better look up these machines (there are five sizes) if you are interested in quantity and quality production.

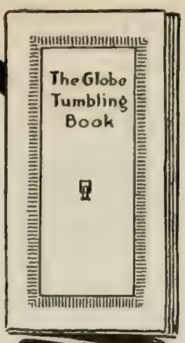
GET YOURS



If you do—or intend to do Tumbling you should have this practical treatise.

It is the result of ten years' experience with Tumbling methods and barrels—and contains many helpful hints.

The man responsible for results in your Tumbling Room may find it instructive.

Your **free** copy is awaiting your call. Mention Canadian Machinery.

Preparedness—

THE watchword of the day. Start now and be ready for the big business that is coming.

SPECIAL machinery and equipment is our forte. We ask the opportunity of having our engineers solve your problems.

LYMBURNER, LIMITED
360 St. Paul St.
MONTREAL, CANADA

MALLEABLE, GREY IRON, ALUMINUM AND BRASS
CASTINGS

Made Especially to Suit Requirements

By making and treating our castings to suit conditions for which they are required we can give you a product that will deliver a maximum of good service.

NOTHING TOO LARGE OR TOO SMALL FOR US TO HANDLE.

Elmes Hydraulic Press No. 676

With ¾-in. Automatic Lever Operating Valve No. 677-A

This press is of steel and semi-steel construction, and the stands which support the press are threaded at the ends to receive the steel columns and have holes for fastening to the floor. The platen is guided by the columns.

The operating valve is attached to the cylinder, and is designed with a weight to be set for the pressure desired, and releases automatically. To start the ram up, the lever is pushed down; upon the ram reaching the desired pressure, the lever automatically releases (acting as a safety valve as well), causing the ram to descend. Valve body is made of bronze, and other parts are made of tool steel and machine steel. If desired a hydraulic gauge can be attached to show the various pressures, although with this valve it is not necessary.

Write for our Hydraulic Machinery Catalogue.
